

Dynamic PowerPoint® presentations with the DATAPOINT add-on

Link the content of your presentations with Excel data sheets, text files and databases.

The solution for **dynamic presentations** with real-time data now also available within Microsoft PowerPoint®.

DATAPOINT is an add-on for **Microsoft PowerPoint®** that is fully integrated in your Office application. As easy as PowerPoint® itself, this add-on gives you the flexibility to link dynamic content from **Excel data sheets**, **text files** and even **databases**.

With a linked presentation DATAPOINT automatically refreshes the content as soon as the data of your external data source is modified. With this mechanism you can always display the latest information of your databases, locally stored or over an internet connection.

With DATAPOINT you can:

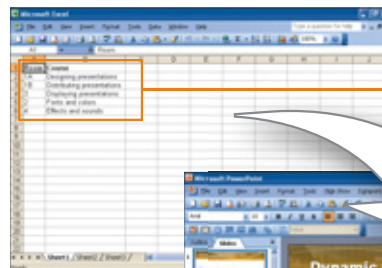

- Display dynamic presentations with real-time information
- Show live charts
- Run a live information system

Advantages:

- Build dynamic PowerPoint® presentations in no time
- No programming or database skills required
- Automatic real-time refresh of data
- The worldwide most affordable solution for dynamic presentations on the market
- Save time and money

1

Excel data sheet

Link your data of an Excel data sheet with the content of a presentation. Choose which data sheet and range will be used in your presentation.

2

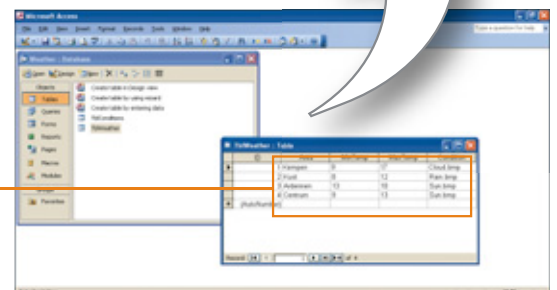

Text file

You can also use a text file as a data source in your presentation. Specify which columns and rows you want to use.

3

Database

With DATAPOINT you can not only link Microsoft Access® databases, but also all databases with ODBC (Open database connectivity) and OLE DB support.

Link your presentations to databases:

Access
AS / 400
DBF / FoxPro
Excel
Exchange

Firebird
IBM DB2
Informix
Ingres
Interbase

MySQL
ODBC
Oracle
Paradox
PostgreSQL

SQL Server
Sybase
Text
UDL
Visual FoxPro

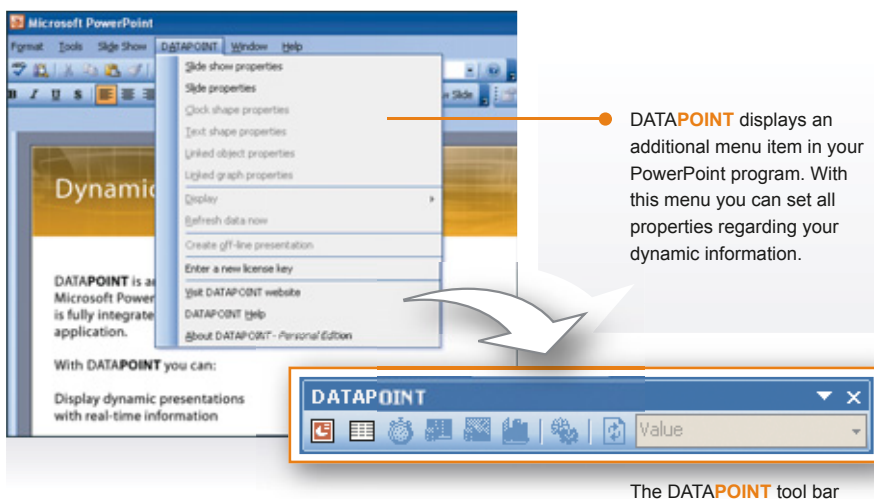

DATAPOINT is adding new functionality to PowerPoint®

Microsoft describes PowerPoint® as 'The Office presentation graphics program' and 'With its easy-to-use tools for creating professional presentations Microsoft PowerPoint long ago transformed the way people communicate ideas'. Completely true with Microsoft about this **but there's one big disadvantage about PowerPoint®: the presentation is completely static.**

The content of a presentation is static and until now the modifications have to be done manually. This is extremely time consuming. With DATAPOINT you can now use PowerPoint for **dynamic presentations** where the content is retrieved from the external data sources in real-time.

All external links are stored inside the presentation and when needed the actual data is retrieved from the data providers. All content in a presentation will be refreshed automatically and in real-time as soon as a change in the external data source is detected.

Fully integrated as an add-on in your PowerPoint® software

Try it 30 days for free

You can evaluate the full functioning demo version of DATAPOINT for 30 days. The license cost of DATAPOINT is based on the number of running implementations. No further costs for E-mail support or product updates are involved. If needed we can build tailor-made presentations with a professional design and customized external data source connections for your company.

“DATAPOINT delivers you an add-on with a high amount of possibilities and a database solution that was missing within Microsoft PowerPoint®.”

Where to use DATAPOINT

Companies

Marketing presentations
Financial analysis
Inform employees

Industry

Display live production figures
Process control
Sales statistics

Banks and finance

Company messages
