

## Corporate Profile

### How It Began...

ScienceLogic was founded in 2003 by technology professionals who are intensely focused on making IT management simpler, better, and faster. Veterans of the information technology and network/enterprise management industries, they had directly experienced frustration that the tools and software available for IT professionals were expensive, inefficient, were not intuitive, and lacked sufficient functionality. They found that the majority of IT departments, over time, have evolved to using a collection of ping tools, home-grown apps, spread sheets and/or databases, and perhaps a thick-client application or two to manage their infrastructure. ScienceLogic knew there was a better way.

Drawing from their experience, expertise, and market knowledge, as well as their work with countless IT professionals, the ScienceLogic team designed and developed the EM7<sup>™</sup> System. An appliance-based Relational Infrastructure Management (RIM) system, the EM7 System incorporates most of the applications, tools, and reporting features that IT professionals really need in one easy-to-use, highly flexible solution. The EM7 System helps today's technologists comprehensively solve important, ongoing service-level impact problems without the frustration and complexities of most management products.

The ScienceLogic EM7 System can be deployed in hours -- not weeks -- and fully configured and customized to meet the need of any environment in just days rather than months. The direct incorporation of workflow and productivity tools into the same data structure as reporting and network/system management provides users with a truly holistic view into all aspects of their IT operations, while increasing user and management efficiency. ScienceLogic offers a full range of EM7 Systems designed to meet the budget and management needs of organizations of all sizes. These products allow customers to start small and grow fast, yielding a high -- and quick -- return on investment while improving operational reporting and practices. In short, ScienceLogic has created a set of products that are *Transforming IT Management*.

### A New Product Category

Having developed a system with functionality and capabilities too unique to fit within any of the established product categories, the ScienceLogic team found that they needed a new category to describe the EM7 System's patent-pending process of integrating disparate IT infrastructure management, security and compliance systems and aligning them with business processes via a centralized single pane-of-glass portal interface and common data store. Putting the EM7 system into any currently existing category would not reflect its unique architecture and capabilities. Thus, Relational Infrastructure Management (RIM) was conceived.

### Competitive Advantage

The EM7 System was built from the ground up as a Relational Infrastructure Management solution. As a result, it is one of the most advanced, flexible, and affordable management products on the market today. Its competitive advantages include:

- Patent-pending technology that combines the functionality of at least eight IT management capabilities in one easy-to-use product
- Framework functionality at a fraction of competitors' purchase price
- 3-5 day organization-wide implementation
- Intuitive functionality and interfaces that require minimal training
- Low maintenance requirements via Auto Update features

- A web-based interface that enables real-time troubleshooting or maintenance assistance
- The ability to begin discovering devices and software within 30-minutes of installation
- A "Single Source of Truth" architecture and design philosophy that stores all mission critical IT infrastructure information within a single data store.

## Primary Markets

ScienceLogic serves a broad range of industries. The company's client base includes organizations from the following sectors: Government, Department of Defense, Internet Service Providers, Healthcare, Banking and Finance, and Government Contractors.

## Solution Set

The EM7 System from ScienceLogic is flexible, easy to use, quick to deploy and offers the most efficient architecture and portal delivery model in the industry.

- **EM7 Management Systems** – ScienceLogic offers three systems that provide extensive management capability to a range of organizations with small to enterprise-class networks. The E1500 is ideal for environments with about 200 devices under management; the E2500 handles up to 400 devices; and the E4500 is ideal for enterprise-class networks.
- **EM7 Extension Systems** – ScienceLogic offers extension systems to enhance and increase the capability of the EM7 system: the E7500 High-Availability Database; the E1540 Application Server; and the E1550 Remote Collector.
- **EM7 Bundle Packages** – ScienceLogic's EM7 also is configured in three bundles that provide integrated systems for various size networks and applications. These are the Enterprise Starter Kit (medium-large network environments; the Provider Starter Kit (for extra redundancy or very large networks); and the Extreme Starter Kit (for environments with thousands of managed entities).

## Partners

ScienceLogic has relationships with a number of resellers who currently are selling the EM7 systems. A complete list of resellers is available at <http://www.sciencelogic.com/index.php?ex=partner/buy>

## Corporate Headquarters

14100 Park Meadow Drive  
Suite 100  
Chantilly, VA 20151
