

COGZ CMMS Software Releases Version 4.50 Increases Maintenance Management Efficiency with New Features

COGZ CMMS Software Version 4.50 is now available from COGZ Systems. With newly added features like even more user customization options, a backup reminder, and enhanced component integration, COGZ Version 4.50 offers users new capabilities to increase maintenance management performance. COGZ Systems, LLC continues to provide new features to make preventive maintenance, work order management, and inventory control even more effortless and with this new version release to the COGZ CMMS program, complete organization of maintenance management is even easier.

Woodbury, CT, October 4, 2005 – With the release of COGZ version 4.50, users now have an enhanced look and feel of a Windows XP, but still with the same user-friendly, dependable program functionality that has always been at the heart of the COGZ CMMS Software.

The Version 4.50 release for the COGZ CMMS software provides users with many new features for their maintenance management needs. Users now have additional work order customization selections as well as an optional workstation bar code application for inventory management. Using the backup feature ensures that users no longer need to worry if a backup has been made of their program with the reminder telling them the last time a backup was created. Users also have the added Priority, Section, Status, and Requester Lists that reduced data entry required.

COGZ Version 4.50 offers users an enhanced foundation for preventive maintenance, work orders, inventory, and purchasing with an intuitive interface. Easily incorporate the new features as the previous version can be quickly updated to this new feature-filled release of COGZ CMMS Software for added efficiency and successful maintenance management. With optional Modules, users have even more features to use in the program for additional capabilities. This enables users to build and update a thriving program that will meet management requirements.
