CyberWorx DLP© - Online Design Software

CyberWorx DLP© Online Design Software allows customers to design and submit ready-to-print artwork directly from printing company's websites.

CyberWorx, Inc. is proud to announce the release of CyberWorx DLP© (Design—Layout—Print), a suite of tools for the printing industry. This new generation of on-line design software allows customers to design and submit ready-to-print artwork directly from your website. It is standardized for business card design, but can be customized for t-shirt, postcard and brochure design.

Technical capabilities of the software package offer a significant competitive edge and include:

- Software saves customers' designs at 300 though 1200 dpi, in a standard vectored image file (EPS, SVG, or SVGZ).
- Customers' system fonts are outlined to eliminate common font matching problems. (Any font, any system, any language)
- Software automatically provides customizable bleed allowance, so customer's design requires little, if any, modifications.

This online design package saves time and money, eliminating proofs going back and forth between client and printer. There is no down time and no expense involved in converting images or layout to a press-ready product. Customers appreciate the flexibility of the program. They are no longer tied to a standard format, substituting their information for that on a pre-designed card and searching, for example, for a design that has a predetermined spot for an extra phone PLUS a fax number. Customers can also import their own logos in a true layered design environment so text can be placed on top of images as desired. Images can be imported in JPEG and PNG (8/24) format. There is also the ability to import from a vectored (.EPS) clipart gallery.
