data that make sense

### DBxtra 2005: Popular Query and Reporting Software Driven to Perfection

*DBxtra 2005 comes with a new user-focused interface and functionalities, including direct SQL editing via the visual query designer, ability to insert multiple charts into reports, grouping ability in web reports with ASP, digital chart dashboards, and e-mail alerts for DBxtra users*

Querétaro, Qro., México - January 9, 2005: Quanticus S.A. de C.V. announces today the unveiling of DBxtra 2005, the newest version of a popular stand alone query and reporting tool for the Windows OS. DBxtra 2005 gives anyone a pain-free ability to connect to multiple databases or data sources simultaneously and, using its powerful query and filtering mechanisms, explore and achieve fine grained retrieval of data to answer business questions. Thanks to its refreshingly uncomplicated, point-and-click approach to building queries and reports, DBxtra can be used by end users totally inexperienced in programming and database management. This leads to increased productivity in the office as users don't have to wait for the IT staff to provide assistance in the extraction of vital information or creation of reports.

### What's New in DBxtra 2005?

According to Rudolf F. Vanek, CEO of Quanticus S.A. de C.V., DBxtra 2005 boasts a handful of improvements that make data extraction and reporting simpler. "One of the main principles that we build on is collaboration with our customers. Their feedback enhances our ability to build the product that is consistent with their expectations and changing business needs. DBxtra 2005 comes as a new response to our consumer suggestions. In this release we have completely rebuilt the user interface, which now has become much easier to work with. For example, our customers can now enjoy a new ability to create queries, reports and ASP web reports in one step, all conveniently from a single window. Other improvements include direct SQL editing through the visual query designer, ability to insert multiple charts into reports, grouping ability in web reports with ASP, digital chart dashboards, and finally e-mail alerts for DBxtra users."

### DBxtra at a Glance

DBxtra enables you to connect to local and internet data sources based at different locations, thus creating a single access point to disperse data. These data sources may include Microsoft Access, Microsoft SQL Server, MySQL, Oracle, DB2, FoxPro, Excel and any other database connected through ODBC. Once connected, you can build queries with powerful expressions and produce professional ad hoc reports in minutes. Web reports can be published to an intranet or web server. Reports can be either printed or exported into a variety of formats, such as HTML, Microsoft Excel, CSV, XML, or PDF with the option to be merged into emails to be further sent to customers, suppliers and business contacts. DBxtra also enables easy creation of live digital OLAP dashboards with Excel pivot tables and charts. Additional convenience comes from the ability to schedule reports and alerts and have them executed automatically.
