Conventional Construction!

Answers to the most frequently asked questions

1. Why should I choose Standard Steel Buildings?

Although there are several steel building companies to choose from it's important to know that we are definitely not created equal. Many steel building companies use the fact that you may not know the difference between one building and another. Standard Steel Buildings takes the time to find out what you need and will show you the options that can affect your pocket book as well as the quality of the building you receive. Our project coordinators will guide you through the entire process from concept to delivery, showing you the best and least expensive way to accomplish your project.

2. Why choose a steel building over other methods of construction?

Steel buildings offer a cost effective, flexible, low maintenance and energy efficient structure that can be designed to fit almost any situation. Every steel building from Standard Steel Buildings comes pre-punched, pre-cut, pre-drilled and pre-welded. By using this steel building manufacturers process, it allows for the building to be erected in a fraction of the time. Steel is the least expensive material of all the available methods of construction, with low initial building cost and virtually no maintenance along with a 25 year limited warranty, steel is a hands down winner.

3. Who will erect my building?

You may be surprised to know that on smaller building projects many of our customers choose to erect their own. For larger building projects, or ones you don't wish to tackle on your own, have no fear. Standard Steel has access to erectors all over the country that know our products and will be happy to erect your new building.

4. Can you deliver anywhere in the USA?

Yes. Standard Steel Buildings are shipped from 12 manufacturing plants within the US. All of our shipping points are AISC certified (American Institute Of Steel Construction) and in good standing with the MBMA (Metal Building Manufacturing Association). We take great pride in only using American steel, ensuring that our customers receive only the best quality commercial steel buildings and steel warehouses available.

5. Will a steel building conform to my local building codes?

Standard Steel Buildings are engineer stamped and certified for all US and local building codes including snow, wind, seismic and exposure ratings.

6. How long does it take to get a building delivered?

Most buildings can be manufactured in as little as 4-6 weeks depending on the size and complexity. It is important to know that every steel building from Standard Steel Buildings is custom manufactured and during certain times of the year the process may take a while longer.

7. Can you insulate a steel building?

Yes. Insulation for a steel building is a little different from what you might be use to. Standard Steel Buildings carry all types and R-value insulation specifically designed for steel buildings.

8. Will I need an engineered foundation design?

Local building department requirements may vary. The best way to know is to call your local building department and ask. If you are required, Standard Steel Buildings can provide you with one for an additional fee.

9. Can I choose the color of the building?

Yes. We have several colors to choose from, and you may select the wall and trim color at no additional cost.

10. Does a steel building have to look like a warehouse?

Not at all, by choosing one of our many exterior options you can make the outside of your new building look like stone, brick, slate, or stucco. We also have a full line of doors, windows and accessories that give you the ability to customize your new building.

11. Do you offer financing?

Yes, through arrangements with several national lenders we offer programs including non-profit, commercial and signature loans. We also have several lenders that specialize in church financing ranging from start ups to multi-million dollar projects.

Steel Buildings no longer have to look like a warehouse.

Standard Steel Buildings work with companies and organizations all over the United States, many of which love the advantages of steel buildings but need a more conventional look. Standard Steel buildings can be designed to look almost any way you can imagine, including stone, brick, slate and stucco. **Standard Steel** also carries a complete line of personnel doors, roll-up doors, windows and accessories that can help customize your new building project.

When you begin to design the look of your new steel building you will find that there are many options available. We believe that of all the choices available, **Dura-flex** is the best. **Dura-flex** is a lightweight, premixed, color integrated stucco textured product that is perfect for steel building applications. The product can be easily applied using local labor and by spraying directly onto the steel sheeting, making installation fast and cost-efficient. One installer and a helper can apply as much as 5,000 square feet a day. Steel buildings as with most structures, expand and contract with temperature changes, causing a variety of problems for most stucco products. **Dura-flex** can stretch up to 105% of its size without cracking or peeling and comes in almost any color you can imagine.

We believe the most important things in building are quality, customer service and warranty. Therefore, we make sure

Standard Steel Buildings are engineer stamped and certified for your local building codes including snow, wind, seismic and exposure ratings. We customize all commercial steel buildings to fit the needs of our customers while providing them with a structure that is both efficient and flexible. **Standard Steel Buildings** are easy to expand which gives you the ability to plan for the future without having to pay for it today.

Steel buildings offer a cost effective, flexible, low maintenance and energy efficient structure that can be designed to fit almost any situation. Every steel building from **Standard Steel Buildings** comes pre-punched, pre-cut, pre-drilled and pre-welded. By using this steel building manufacturers process, it allows for the building to be erected in a fraction of the time. Steel is the least expensive material of all the available methods of construction. With low initial building cost and virtually no maintenance along with a 25 year limited warranty, it's easy to see why more people are turning to **Standard Steel Buildings**.

Commercial steel buildings can maintain a clear-span of up to 300 feet wide. By having a large space that is column-free, you gain the flexibility to satisfy even the most complex space design needs while still maintaining an obstacle free environment.

Frame Designs

CLEAR SPAN

Tapered columns and rafters give optimum clear span capabilities while keeping unused interior clearances at a minimum.

MULTI SPAN

Offers the most economical cost per square foot for buildings over 80' wide. Ideal design when interior columns are not objectionable.

CLASSIC

Straight columns and rafters. This design is common on smaller width buildings. Easy to finish the interiors.

HIGH SPAN

Gives the same design benefits as the CS. Steeper pitch offers more interior height when required.

SINGLE SLOPE

Single slope, tapered columns. Especially suited for commercial stores. Offered with interior columns as well.

LEAN-TO

Used to add space at sides or ends. It differs from the single slope in that it must be supported on the high side by an adjoining building column.

CUSTOM DESIGNS

Special framing systems can be provided to meet unusual building requirements.

Standard Steel Buildings

If you can dream it... We can build it.

We provide our customers with a project coordinator that will walk you through the entire project from concept to delivery.
