

# Strong Authentication Made Simple.

MyPW is an online service that enables websites to quickly and easily integrate hardware-based authentication into their existing systems.

Use MyPW to implement two-factor authentication today.

## Key Advantages of MyPW

### ≡ Easy to Implement

There is no software to install. Just use your choice of standard protocols to access the MyPW service.

### ≡ Easy to Administer

All management can be done via the MyPW website and service interface.

### ≡ Carry a Single Device

Unlike other systems, in which each site requires its own device, a MyPW device can be used to secure accounts across multiple MyPW-enabled websites.

### ≡ Pay as you Go

There are no minimum buys, setup fees, or support contracts. Just pay for what you are actively using.

MyPW provides your users with a password token device, small enough to fit on a keychain.

When the user logs into your website, you ask them to enter the code shown on the device, in addition to their password.

After validating that their password is correct, you make a simple call to the MyPW service to check that the code is also correct.

Even if someone has the user's password, they cannot access their account without also having the physical device.
