

NLE Announces Release of Library Application Delivery Suite

April 17, 2007 Orem, Utah- NLE (National LAN Exchange), a leader in designing and implementing network solutions, is pleased to announce an original complete network integration solution for libraries. NLE has deemed this solution, “Library Application Delivery Suite[™]” (Library-A.D.S.). NLE’s continuing focus on libraries has led to the creation of a multi-layer approach to manage common threats to libraries.

“As libraries continue to provide services that are beyond their internal infrastructure, i.e. internet based applications; libraries need control over application delivery to assure a positive patron experience. This solution suite has several components.” says Eric Winegar, President and CEO of NLE. The Library Content Threat Manager, Library Network Visualizer, Library Wireless Controller, and Library Network Device Reporter make up the suite.

By offering a comprehensive network solution, NLE is able to manage content, provide CIPA compliance for web-content filtering, and threat management at the network layer. NLE espouses ease of administration, low cost, and simplified maintenance, in addition to delivering performance and value to libraries. This solution promises to help create the “library of the future”, Winegar continues. NLE has been providing high quality products, leading communication and network systems, ongoing support and technical assistance since 1992. NLE is headquartered in Orem, Utah. <http://www.nle.com>
