CorasWorks Releases Next Generation of CorasWorks Workplace Suite Version 10 Enables Users to Design Better, Build Faster and Manage Easier

Reston, VA – March 3, 2009 -- CorasWorks Corporation, a leading provider of software that makes it easier to develop applications on Microsoft SharePoint, today released version 10 of the CorasWorks Workplace Suite. The Workplace Suite is part of the CorasWorks Modular Application Development System, an application development system that has been deployed in more than 1,000 enterprises worldwide and enables organizations to design, build and manage applications in SharePoint without the costs and complexity of custom code development.

“Version 10 of the Workplace Suite is a completely new build and further extends our leadership in delivering the SharePoint community a comprehensive application development platform that enables organizations to gain maximum business value from their SharePoint investments,” said Gary Voight, CEO of CorasWorks. “SharePoint continues to be a strong and growing development platform within the enterprise. The CorasWorks Workplace Suite, built on top of Microsoft SharePoint, gives organizations maximum business value at a significantly lower price point than traditional SharePoint implementations using custom development.”

CorasWorks Workplace Suite version 10 is a comprehensive modular application development system that enables organizations to more effectively design, build and manage SharePoint environments without having to write custom code. Version 10 is the fourth generation of the system and takes advantage of new AJAX/Web technologies, unleashing end-users and power users to be more productive on the SharePoint platform.

Key features and capabilities of version 10 include:

- **Design Tools** – Proven tools such as starter templates, master page wizards and navigation tools enable users to design high-performing, stable and sustainable solutions.
- **“Builder” Wizards** – For faster construction and lower operating costs, users will have the ability to build rich Internet applications with mouse clicks instead of custom code.
- **One-Touch Management System** – Features like centralized management and configuration, component lock-down, global links and programmatic site updates will significantly reduce the total cost of ownership of SharePoint solutions.
- **End-user Forms** – Custom forms and out-of-the-box forms make it easy for users to add and edit data.
- **Business Process** – Users can increase their productivity by using end-user actions / automation and workflow capabilities such as event-based triggers, scheduled activities and email notifications.
- **Displays, Dashboards and Reporting** – Features such as grids, charts and calendars, data connections and aggregation, and custom reports and views deliver real-time data and increase user adoption by bringing the richness and usability of the Web to SharePoint solutions.
