SOFTWARE

iabol 2.0 Shipping System

Web-Based Shipping System from ABOL Software

Overview

iabol allows you to manage all of your shipping activities through the Web and supports the complete line of services from all major carriers and consolidators, including PC Postage. iabol is scalable with customizable shipping preferences, importing of your contacts or individual orders and integration with your current business systems. iabol becomes the complete parcel and mail solution for label printing, shipping and manifesting.

iabol is accessed through the Internet from an Internet Explorer Web Browser. Shipment data is automatically transferred to the carriers. An electronic manifest and printable version are created through the End-of-Day closeout.

Labels may be printed individually for each mailpiece or in batch for a run of identical pieces. Reporting tools give you access to shipping information including manifest summaries and shipment details. Tracking information available on the carrier's website is also accessible from within iabol.

Getting started is as easy as logging onto the iabol site and entering shipment information. The shipping process can be optimized by configuring iabol to receive information from a barcode scanner and scale connected to the shipping station or a database on your local network. iabol integrates into existing systems through the use of ODBC connections, and the web-based architecture allows it to be run alongside systems provided by other carriers. Contact us toll free or by email below to learn more about bringing the internet to shipping!
