Demand Manager

Minimize Inventory Investment, Maximize Customer Service

Figuring out the right stock levels can be quite a task. You need the right product, in the right location, at the time promised—without carrying too much inventory buffer.

RockySoft's Demand Manager (DM) software for Distribution delivers the tools you need to make better stocking decisions. Integrated demand forecasting and inventory planning software helps you effectively manage on-hand inventory levels. DM leads to less inventory on the shelf, higher fill rates, and better customer service.

Take Costs Out of Inventory

Carrying extra inventory, especially for extended periods of time, can quickly eat away at margins. RockySoft's Demand Manager synchronizes stock levels with forecasted demand. Its demand volatility and forecast stability features help you make informed inventory decisions and fewer mistakes. There's no need to carry surplus stock to offset forecasting errors. With the surplus gone, so is the cost of extra inventory, the loss of working cash, and the ongoing holding costs.

Better Fill, Better Customer Service

With the DM, you're armed with key forecasting tools to help you anticipate future customer demand. Exception-based forecasting lets you prioritize and keep a close eye on key products. At the same time, forecast deviation tools provide the visibility to see which SKUs are at risk—even across multiple distribution centers. You know what to carry and when to carry it, improving fill rates and customer service levels.

Promotional Events

Inject marketing insight into the forecast to capture promotional and marketing initiatives. Gain deep visibility into customer buying patterns. Easy-to-understand presentation of future promotion and past sales performance will measure the effectiveness of promotional sales campaigns.
