

New Features of TRM RulesManager

-  **Qbe Filtering:** Default the values on your List pages based on your custom JavaScript conditions.
-  **Restricted Results:** Enable Restrict Results rules only when your custom JavaScript condition is met.
-  **OnModify:** A new event captured by RulesManager when a Record is modified from its original state.
-  **OnCommit:** A new event captured by RulesManager when a modified Record is marked as unmodified. This event occurs after an OnSave but before an AfterSave event.
-  **OnFieldInit:** A new event captured by RulesManager when a field is initialized. Instead of initializing your fields on init, this event gives you more control over your system resources. The event is only fired if the field is in use by the application.
-  **Wizards:** A new set of user wizards to guide less experienced developers through the creation of some of the more basic rules.
-  **ValueLists:** Upon user request, we've added even more functionality to our already feature rich ValueLists.
Bind your list to multiple columns and fields.
We've redesigned the foreign datasource so that users will no longer have to worry about memory management when using them. Design your sql statements with no reservations
-  **Tables:** Added control over table presentation. Hide columns or color rows based on your own JavaScript conditions.
-  **Libraries:** Ever wanted to switch tabs? Automatically open a new browser to an address in google maps? Retrieve data from a Webservice in your rule? Automatically create a PO from a PR? We've added some free libraries that give you just that.
