What Is Auslogics BoostSpeed?

Auslogics BoostSpeed is your one-stop computer maintenance and optimization tool, providing you with everything you may need to keep your computer running fast and smooth.

Benefits at a glance

- Faster computer
- Stability increase
- Privacy protection
- Full system control
- Faster Internet
- Over 18 powerful tools

With more than a dozen powerful tools you will be able to defragment, cleanup, repair and optimize your system, speed up Internet connection, remove junk files, protect your privacy and tune up your PC to your liking.

Features

| **Disk Cleaner**	**Disk Defrag**	**Registry Cleaner**
Removes junk files slowing down your computer	Defragments disk drives and optimizes system files placement	Repairs thousands of registry errors to increase PC stability
Registry Defrag	**Disk Doctor**	**Internet Optimizer**
Compacts the registry eliminating memory-consuming gaps	Finds bad sectors, lost clusters and directory errors and fixes them	Tailors the one-size-fits-all settings to your specific Internet connection
Track Eraser	**Disk Wipe**	**File Shredder**
Removes the history of your computer and Internet usage	Wipes free space on disks to prevent the recovery of sensitive data	Erases selected files beyond recovery on a disk or USB stick
File Recovery	**Duplicate File Finder**	**Services Manager**
Recovers accidentally deleted files from disks, USB sticks or cameras	Helps to find and remove duplicate files that waste disk space	Disables unnecessary services slowing down your computer
Startup Manager	**Uninstall Manager**	**Tweak Manager**
Allows to manage programs that start automatically on Windows boot	Completely uninstalls the software programs that you no longer need	Allows to tune hundreds of Windows settings to increase your PC speed
Task Manager	**Disk Explorer**	**System Information**
Lists all running processes, services and locked files	Shows which files take up the most space on your computer	Provides detailed information about your hardware and software

Installing the Program

Before installing the program, check that your computer meets the following hardware and software requirements:

- Windows 7, XP or Vista (32-bit and 64-bit supported)
- 50 MB of available hard-disk space
- 256 MB RAM or more

Start the **Setup Wizard** by double-clicking on the downloaded file. If you bought the program on a CD, insert the disk into a CD/DVD drive which will launch the **Setup Wizard**.

If the program does not start automatically, open **My Computer**, select the CD/DVD drive and double click on the program file to launch it manually.

Follow the instructions of the **Setup Wizard**. If you have an older version of Auslogics BoostSpeed, then the program will uninstall it automatically.

Main Window

To start the program, double click on the Auslogics BoostSpeed blue globe icon on your desktop. The main window will open where you can instantly see your system status, scan area and the quick tasks. If the program recommends to scan the system, simply click on the **Scan Now** button and follow the instructions.

① Select the areas where you want the program to look for errors, junk files and other problems

② Click on the **Scan Now** button to begin the scan, or click on the arrow to select advanced scan options

③ You can switch to additional tabs with resource usage information, advice on optimizing computer, or advanced tools

④ Use the quick tasks if all you want is to quickly erase history, clean up temporary files or optimize computer memory
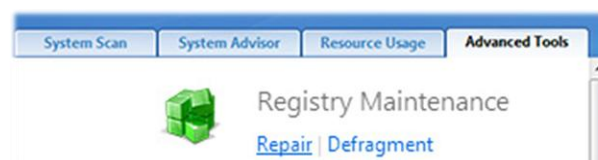

Registry Maintenance

The registry is the main database of the Windows system. It is where crucial settings of each application and driver are stored. When running, a program may access the registry thousands of times per second.

Registry errors can cause many problems, starting from computer slowdowns to system hanging and crashes. Keeping the registry in good shape means better computer performance and stability.
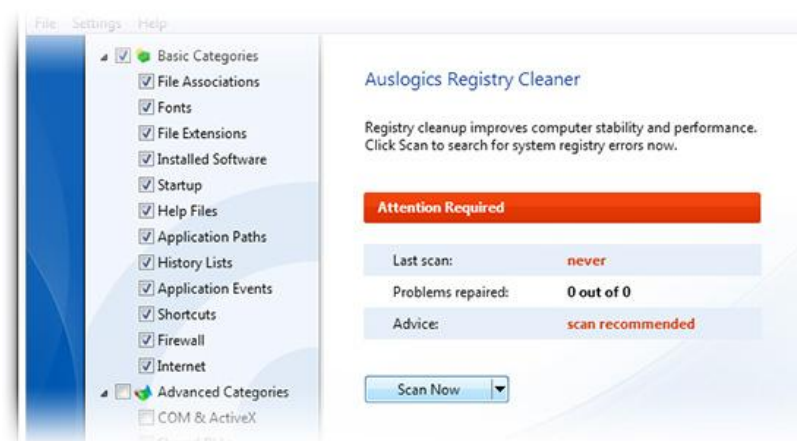

How to Maintain the Windows Registry.

BoostSpeed includes two essential tools for keeping the registry clean, compact and error free: Auslogics Registry Cleaner and Auslogics Registry Defrag.

These utilities can be launched under the **Advanced Tools** tab in the main window of the program.

We recommend cleaning the registry at least once a week. To do that, click on the **Repair** entry of the **Registry Maintenance** section. A new window will appear:
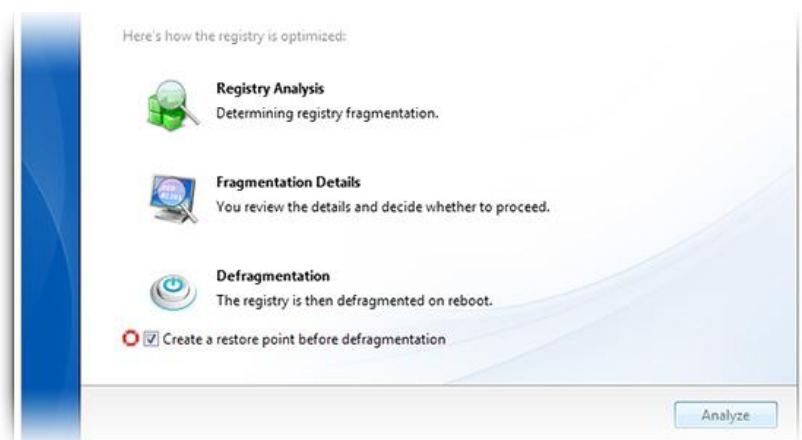

Select categories you want the program to scan for errors and click on the **Scan Now** button.

After the scan is finished, you will be presented with a list of detected problems. You can view detailed information about each problem found.

Click on the **Repair** button to fix all problems immediately.

Auslogics Registry Defrag is the other essential tool. It eliminates structural defects of the registry and compacts it, reducing the amount of RAM the registry takes up. To launch the Registry Defrag tool, click on the **Defragment** entry of the **Registry Maintenance** section.

Click on the **Analyze** button in the Registry Defrag window to start the registry analysis.

The program will scan the registry to see how much fragmentation there is and if the registry needs to be defragmented.

When the analysis is over, click **Next** to defragment the registry.

Disk Maintenance

Any hard disk becomes fragmented and cluttered with junk files over time. This is one of the most common reasons of computer slowdowns. Auslogics BoostSpeed has all the tools needed to get the most out of your hard drive performance.
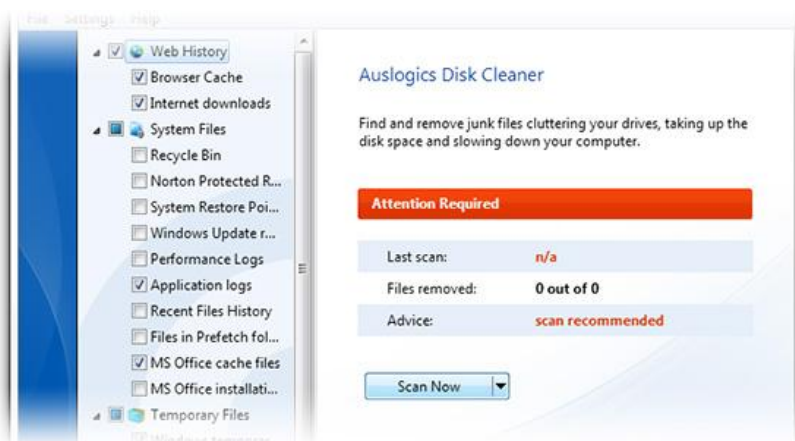

How to Maintain a Hard Disk.

1. Clean it up. With Auslogics Disk Cleaner tool you can clean up your disks from useless files that waste space and slow down your computer. These may be temporary files, Web browsers cache, junk files left by online chat programs like MSN or Yahoo Messenger and other debris.
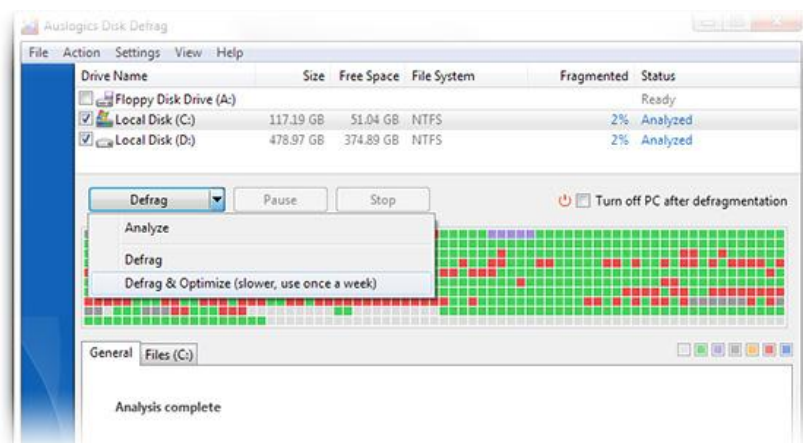

To launch the Disk Cleaner tool, click on the **Cleanup** link of the **Disk Maintenance** section.

Specify where the program should look for junk files and then click on the **Scan Now** button.

After a short scan you will see the junk files and their location on disk. Select the files you want to delete and click **Remove**.

2. Defragment. BoostSpeed includes our famous defragmenter - Auslogics Disk Defrag. This tool can defragment files, consolidate free space and move system files to the faster part of the disk. This greatly improves applications response time, system boot speed and overall computer performance.

Click on the **Defragment** link of the **Disk Maintenance** section.

Select the disks you want to defragment and click on:

Analyze to determine disks fragmentation level;

Defrag to defragment files;

Defrag & Optimize to defragment files and consolidate free space.

3. Check for Errors. One of the new tools in BoostSpeed 5 is Auslogics Disk Doctor. This tool checks disk drives for problems related to bad sectors, lost clusters and directory errors. With Disk Doctor you will be able to recover data from unreadable sectors and monitor your hard drive health.

Please note. We recommend running the Disk Doctor tool once a month to check the health of the disk drives on your computer. If you start seeing a lot of bad sectors, backup and replace the faulty disk to prevent data loss.
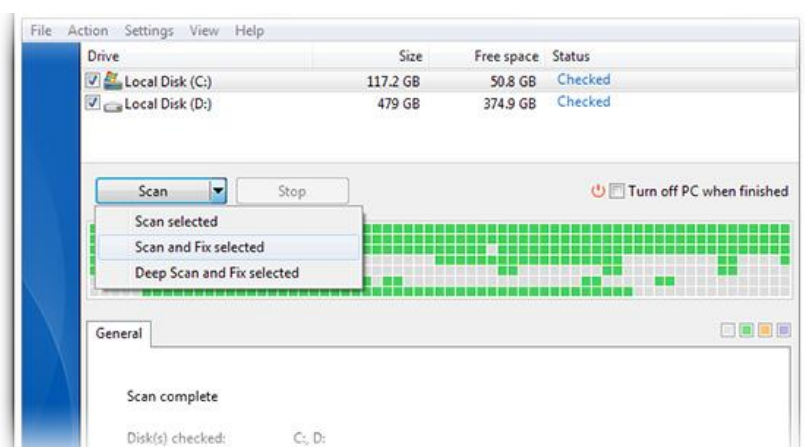

Click on the **Repair Disks** link of the **Disk Maintenance** section.

Select the disks and click on:

Scan selected to analyse disks without repairing errors;

Scan and Fix selected to repair errors without scanning the volume for bad sectors;

Deep Scan and Fix selected to repair errors, locate bad sectors, and recover readable information.

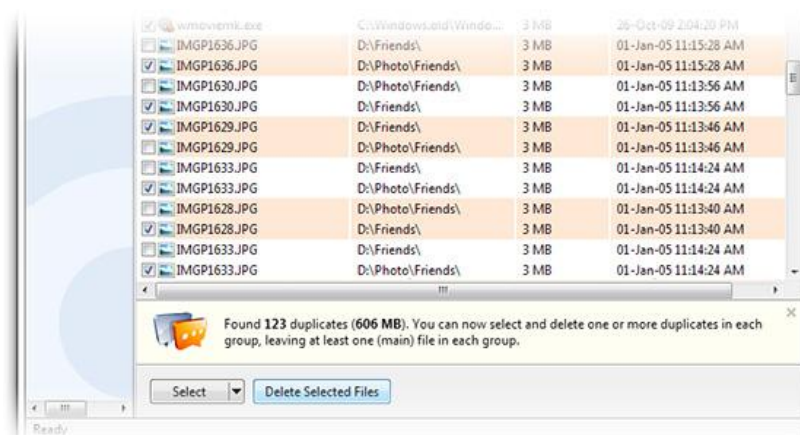

Disk Space Management

Daily computer activity inevitably leads to large number of useless files accumulating on your computer, even more so if you are an active PC user. You may download gigabytes of music and video files, documents and applications from the Internet and not even realize how many identical files or files that you don't really need any more are stored on your hard disks. With Auslogics BoostSpeed you can organize documents, media, and other files to increase free space on the disks of your computer.

How to Manage Disk Space Usage.

1. Find and delete identical files. Keeping unnecessary duplicate files on your computer means wasting valuable hard disk space. Auslogics Duplicate File Finder will help you to get rid of those files. With this utility you can increase free space by up to 50%.

To launch Duplicate File Finder, click on the **Remove duplicates** link of the **Free Up Space** section.

Select the folders where you wish the program to look for identical files and specify which file types the program should look for.
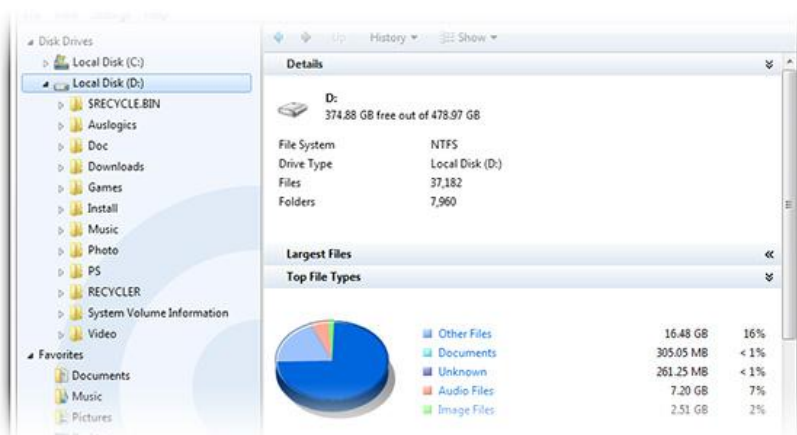

After the scan is finished you will be able to select the duplicate files you want to delete.

2. Organize files and folders. Auslogics Disk Explorer is designed to help with tracking disk space usage. This tool will show the largest files and folders on your disks, so you can free up additional space by archiving them onto a CD or DVD.

To launch Disk Explorer, click on the **Explore disks** link of the **Free Up Space** section.

Select disks you wish the program to analyze and click **Scan Now**.

You will then be able to see which files and folders take up the most of the disk space, as well as some useful statistics. Click on the **Show** button to choose between several views.

System Speed Up

Auslogics BoostSpeed offers over hundreds of settings to tune your system for maximum performance and speed up Internet connection.

1. Optimize Internet connection. With Internet Optimizer tool you can speed up Internet connection by optimizing numerous settings like Max MTU and RWIN specifically for the type of Internet connection you use.

If you want the program to optimize your Internet connection automatically, click on the **Automatic** entry of the **Speed Up Internet** section and follow the program's instructions.
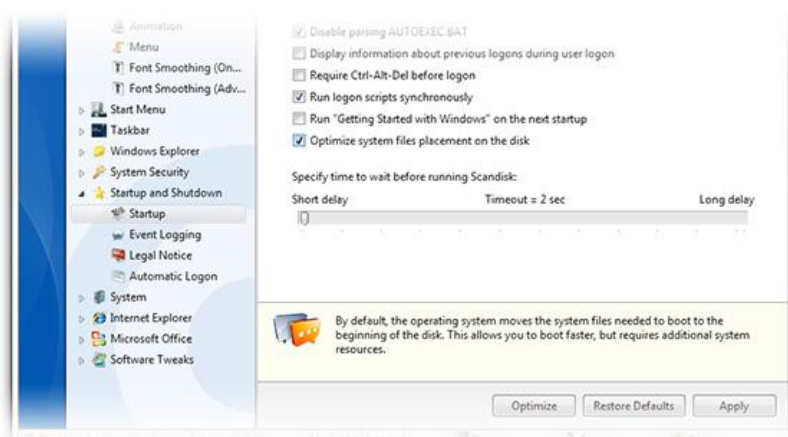

You can also customize all settings manually. To do it, click on the **Manual Optimization** entry. In the right-hand column you will find detailed description of each setting.

2. Tweak Windows to its peak performance. Auslogics Tweak Manager tool includes lots of undocumented Windows settings that can be customized to speed up your system. All settings come with descriptions that make it easy to understand what you are doing.

To launch the Tweak Manager tool, click on the **System Tweaks** link under the **Advanced Tools** tab.

In the right column of the appeared window you can select categories you wish to customize.

Each option has a tweak rating, telling you how much effect changing the setting will have on your computer performance.

System Control

Auslogics BoostSpeed provides you with a set of tools that will help you to control every task, service or application running on your computer.

---

1. Control startup programs. Reducing the number of programs that start automatically will make Windows boot faster and free up system resources. Auslogics Startup Manager lists all startup programs installed on your system and allows you to disable the programs that you use occasionally or don't use at all.
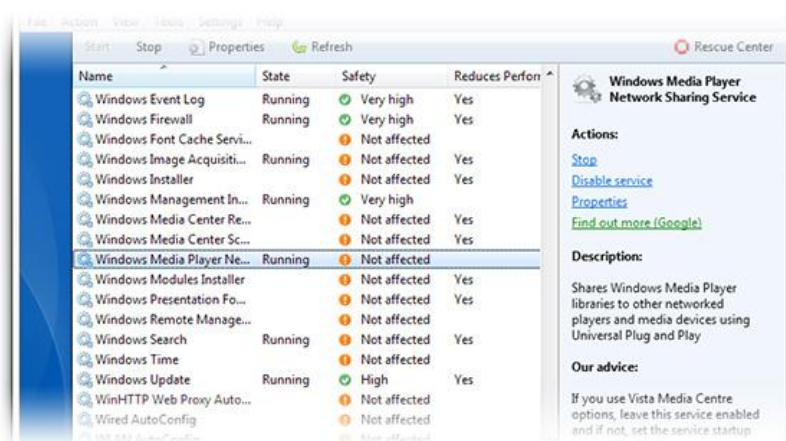

To launch the Startup Manager tool, click on the **Startup items** link of the **Software Control** section.

Manage the list by adding new programs or removing unnecessary startup applications.

You can also disable any program before removing it from the list to see the effect the change will have on your system.

2. Disable unnecessary services. There are some services constantly running on your computer that you don't really need. Each of them uses valuable system resources - memory, CPU and hard drive. Disabling these services may significantly increase your computer performance.

Auslogics Service Manager will help you to identify and disable unnecessary services by providing you with comprehensive descriptions and recommendations regarding each running service.

To launch the Service Manager tool, click on the **Services** link of the **System Status** section.

Select the services you don't need running on your system and click on the **Disable service**.
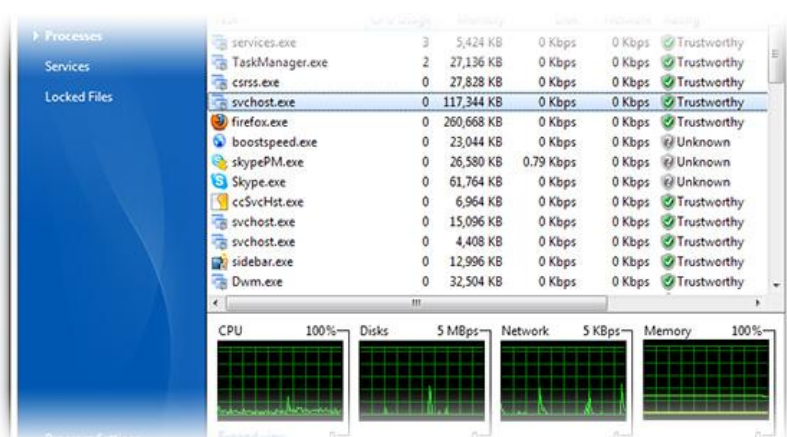

If you are not sure whether you need a particular service, please read the description and the advice concerning its usage, displayed in the right column.

3. Control processes running on your computer. Auslogics Task Manager lets you track all running applications, processes and open files. It displays how much CPU, RAM and disk is used by an individual program or a process, as well as the total consumption of system recourses. It also allows you to speed up individual processes by bumping up their priority.
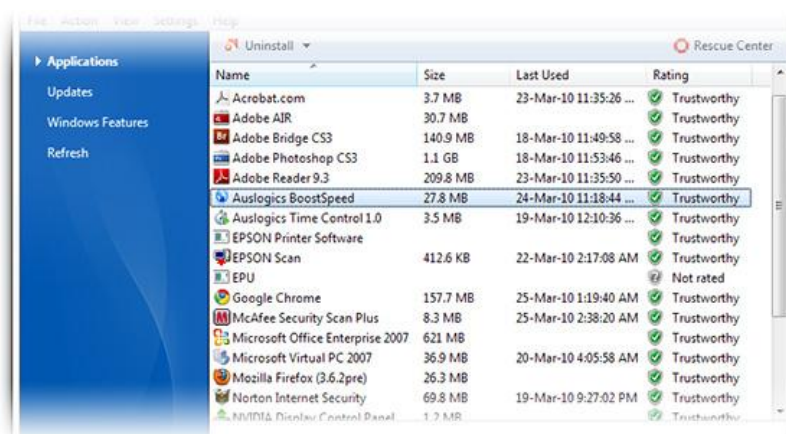

To launch the Task Manager tool, click on the **Tasks** link of the **System Status** section.

Select one of the categories on the right: **Applications, Processes, Services or Locked Files**.

If there are processes believed to be dangerous, Task Manager will warn you about them, so you can easily end the processes or find out more about it in the Internet.

4. Remove unnecessary applications. Auslogics Uninstall Manager shows you the list of all programs installed on your computer and allows you to easily uninstall any of them. Uninstall Manager displays detailed information about each program, including its publisher, current version, installation size and location on disk. You can also see which programs you hardly ever use and decide whether you need them or not. In addition, Uninstall Manager warns you if there are programs believed to be spyware or adware.

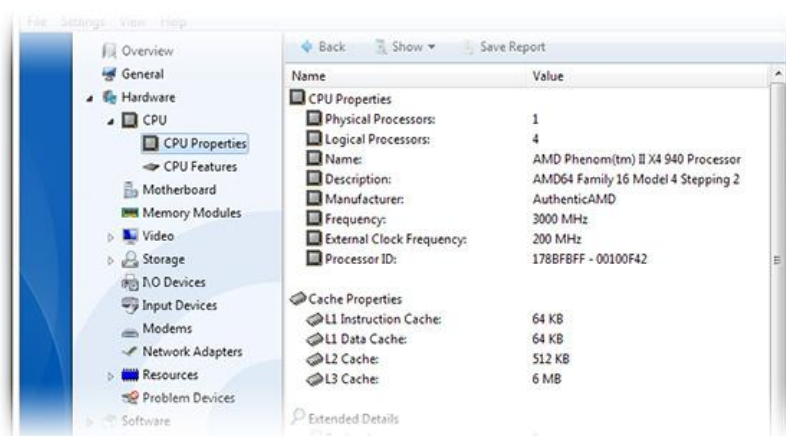

Click on the **Installed Software** link of the **Software Control** section, select the program you want to remove and click on:

Uninstall to launch the program's uninstall wizard;

Quiet Uninstall to quickly remove the program;

Force Remove to delete the program's registry entry.

5. Get to know your computer better. Auslogics System Information provides comprehensive and easy-to-understand information about your computer. It will show hardware configuration and operating system details, as well as all programs and drivers installed on your PC. It can also generate a detailed report containing all the information about your system in a single file. This feature will be useful if you need to provide a technical support team with information about your computer.

To launch the System Information tool, click on the **System info** link of the **System Status** section.

The starting page shows a short computer configuration and operating system summary. You can select one of the 19 categories from the program menu to get the information you need. Alternatively, click on the **Save Report** link to obtain a detailed system information report.
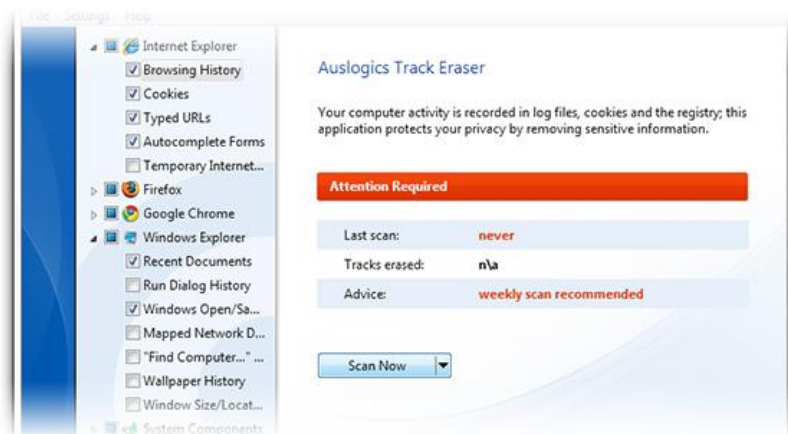

Privacy Protection

1. Hide your computer activities. When you surf the Internet, open documents or run various programs, your activity is recorded in "cookie" files, temporary Internet files and the registry. This means that people who have access to your computer can easily see which web sites you have visited or which documents, images and applications you've recently opened. Track Eraser will protect your privacy by removing this confidential information from your computer.
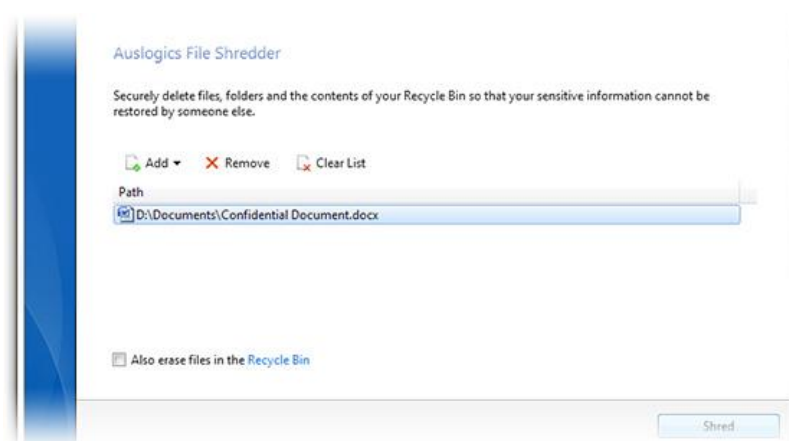

To launch the Track Eraser tool, click on the **Erase history** link of the **Privacy** section.

In the list on the right hand side of the window select the history tracks you want the program to look for click on the **Scan Now** button.

After the scan is finished, select the history tracks and files you want to remove and click on the **Erase** button to remove them.

2. Delete files beyond restoration. Did you know that by simply deleting files or folders in Windows you just remove references to them but not the actual data? Files you think were deleted in fact remain intact on the disk for some time and can be easily restored with data recovery software. Auslogics File Shredder was designed to permanently delete files, folders and the Recycle Bin contents, so your sensitive data cannot be restored. It provides four different shredding algorithms: from fast to military-grade privacy level.

To launch the File Shredder tool, click on the **Shred files** entry of the **Privacy** section.

Click on the **Add** button to add files and folders you want to shred.

You can also drag files to the program's window directly from Windows Explorer.
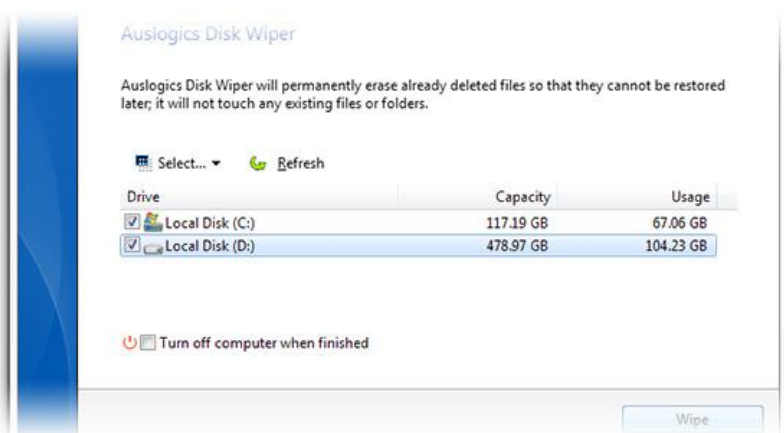

Click **Shred** to delete selected data permanently.

3. Wipe sensitive data. Unlike File Shredder, this tool wipes free space on an entire drive, making sure that files you have deleted previously can't be restored. To provide extra security, Disk Wiper allows turning off System Restore while wiping a disk. Since System Restore keeps track of files changes, turning it off ensures that no file copies will be created during wiping.

To launch the Disk Wiper tool, click on the **Wipe disks** link of the **Privacy** section.
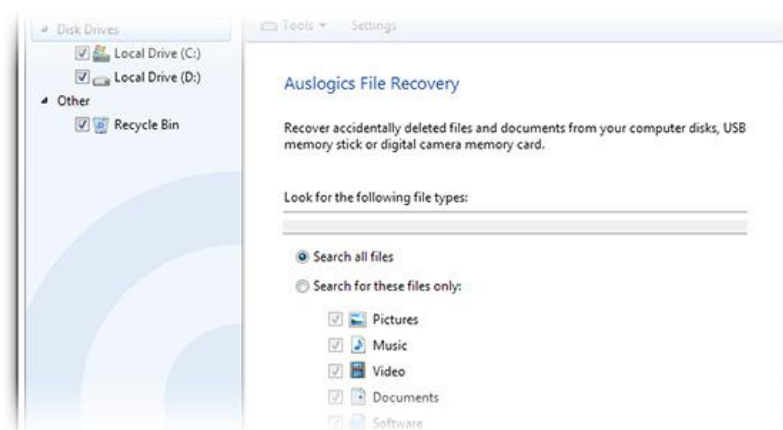

Select the disks you want the program to wipe and click on the **Wipe** button to start erasing deleted data.

To change wipe method, click on the **Settings** in the main menu. Select **Wipe settings** tab and specify how the program should wipe the disks.

Disaster Recovery

1. Recover accidentally deleted data. Lost an important document or picture? Auslogics File Recovery tools will save you from panic. Don't let months or years of your work disappear with accidentally deleted documents, pictures and other important files. Use this program to recover deleted files or files damaged by applications, spyware or computer viruses.

To launch the File Recovery tool, click on the **File Recovery** entry of the **Disaster Recovery** section.

Select the drives you want to scan for deleted files and specify the types of files you are searching for and the date the files were modified.

Note. The more accurate your file search criteria are, the easier it will be to find the deleted files you were looking for.

2. Back up changes made to your system. Designed to clean, optimize and protect your computer, Auslogics BoostSpeed is absolutely safe to use. All changes made by the program on your computer are stored in the Rescue Center. If you experience any problems caused by the program, you can easily roll back the changes made to the system.

To launch the Rescue Center, click on the **Rescue Center** link of the **Disaster Recovery** section.

Select the backup you want to restore and click on the **Restore** button in the toolbar above the list to undo the changes made by the program.

You can select which BoostSpeed tools should back up their changes in the Rescue Center **Settings** menu.
