### Oxygen Forensic Kit – Portable Phone Forensics Solution For Complete On-The-Spot Analysis

*Now, thanks to Oxygen Forensic Kit from Oxygen Software, the police, intelligence services and detective agencies can start forensic investigation of smart phones, mobile phones and PDAs immediately at the crime scene. Complete out-of-the-box tool delivers a full-cycle process from data acquisition and data carving to analysis and report generation.*

**MOSCOW, Russia – June 02, 2011** – Oxygen Software, the provider of computer forensic technologies and software products for police and security services, today announces a new portable device for on-the-spot extraction and analysis of forensic data from mobile devices, Oxygen Forensic Kit.

Mobile phone data is an important part of any police investigation, and extracting on-the-spot data from a seized device is crucial to collecting evidence. Typically, to examine a mobile phone, the investigator has to take the device to the forensic laboratory where a computer with specialized software is installed. The recent innovation from Oxygen Software is changing this scheme completely. All the tools the investigator needs for a fully-fledged forensic investigation are in the bag, so it is possible to examine the contents of the phone right at the crime scene.

Oxygen Forensic Kit is a complete and open solution at the same time. On the one hand, it contains preinstalled phone forensics software and drivers required to connect various devices. The set of cables allows connecting both modern and old devices. On the other hand, experts can add their own preferred software, plug other specific cables and use the kit as if it were your regular workflow in the forensic lab.

"With Oxygen Forensic Kit, you get the complete solution not only to perform data extraction, but also to analyze user data and get first results immediately without having to send a device to the lab. Moreover, you can install any additional software and use it as part of your portable phone forensics kit. Oxygen Forensic Kit has several unbeatable advantages: portability, completeness, scalability and the price, of course. Don't you want to save about 2500 USD and get a complete ready-to-work solution, rather than order all components separately and spend your own time on configuration?" says **Nikolay Golubev**, Manager of Public Relations, Oxygen Software.

Oxygen Forensic Kit includes:

- Tablet PC 10.1" Multi-touch screen, Intel Atom 1.6 GHz, 250GB HDD (or 32Gb SSD + 32Gb USB Flash Drive), 2GB RAM, 3 x USB ports, Wi-Fi, Bluetooth, Camera;
- Tablet PC stand and leather carrying case;
- Preinstalled Windows 7 OS Home Premium 32 bit with the original DVD from Microsoft Company;
- Preinstalled, tuned and ready to use Oxygen Forensic Suite, Analyst license;
- DVD Box with Oxygen Forensic Suite, USB Dongle Analyst for another Desktop computer;
- Preinstalled and configured Oxygen Drivers Pack;
- Full and up-to-date Oxygen Cable Set;
- Printed Getting Started Guide for Oxygen Forensic Suite;
- Printed Devices and Cables Compatibility Guide;
- Roomy suitcase.

The solution is targeted at experts from forensic investigation departments of police and other law enforcement agencies, security services in organizations and enterprises, ensuring the protection of trade secrets, as well as experts from private detective agencies. Depending on the requirements of the client, Oxygen Software can replace Tablet PC with any other model of a computer with the agreed configuration.

The solution is scheduled for release on September 1, 2011. Pre-order of the product is available instantly at a special price.

As a part of Oxygen Forensic Kit, Oxygen Forensic Suite 2011 (Analyst license) acquires all phone data and presents it onto the computer screen providing powerful data carving tools, printing and reporting abilities. With Oxygen Forensic Suite experts can find out the exact place where the suspect was at the time of a call or used internet connection; reconstruct the approximate route of the suspect on Google Maps and Google Earth using geolocation coordinates stored by the smart phone; view all actions of the phone user in the chronological order; ascertain people who actively contact the suspect. By analyzing user data from applications, experts can reveal logins and passwords to popular social services, extract cached files and deleted data, analyze user correspondence and dictionaries. Extracted information also includes a basic data set, including phone and SIM-card data, phonebook contacts, calls, SMS / MMS / Email messages, tasks, notes, camera pictures and video, Lifeblog data, GPRS and Wi-Fi data traffic, mobile applications data (passwords and logins) and a lot of other valuable information.

## Pricing & Availability

The release of Oxygen Forensic Kit is scheduled for September 1, 2011. However the pre-sale of the kit started today and interested users can order the product instantly. For all customers who buy the kit before September 1, the product is available at a discounted price, only 3799 USD (2799 EUR). Volume discounts are available.
