

New Android™ App: Smart WiFi for Android™ Smartphones

Smart WiFi manages the smartphone's WiFi connectivity in order to preserve battery power. This Application switches the WiFi function off when a hotspot is left, and back on as soon as a hotspot is entered again. Normally the WiFi would stay on, continuously searching for a suitable network, thus draining the battery.

Hong Kong (PRWeb) June 10, 2011 – The WiFi function on a smartphone is besides being an unmissable feature, also one of the features that consumes the most battery power. When not connected to a WiFi hotspot the phone keeps searching for a suitable network to connect to, using unnecessary battery power.

Thanks to Smart WiFi, Android™ users now have the option to preserve battery power by effectively managing their WiFi connectivity. Already a huge success for BlackBerry® Smartphones, this application is now also available for Android™ Smartphones. Smart WiFi leverages from the Android™ always being connected to the network carrier. By combining cell tower and WiFi hotspot information WiFi is turned off when not needed and turned back on when needed. Because WiFi is one of the biggest consumers of battery power when searching for WiFi networks this has a tremendous effect on your battery life.

By remembering cell tower information, Smart WiFi detects when a hotspot area (e.g. home or office) is left and WiFi is turned off automatically. In doing so, this saves a lot of battery power. Whenever a hotspot area is entered again, Smart WiFi automatically switches the WiFi function back on, allowing the user to use WiFi as usual.
