

Affordable and flexible e-discovery software for litigation support in a cross-browser compatible environment

## Accessible Everywhere

InControl™ is cross-browser compatible and runs on Mac, PC and iPad with no downloads or plug-ins required by the user. It provides project review teams the flexibility they need to run smooth and cost efficient reviews. It can be accessed in any internet browser, such as Chrome, Safari, Firefox, and Internet Explorer. From work, from home or on the commute, InControl™ is accessible.

Accessed through a secure data center at one of our installed partners, InControl™ technology responds to the need for law firms and corporations to meet the requirements of producing data for litigation purposes.

## Affordable

Reveal technology is offered at a highly competitive price point. Service providers and law firms can quickly recognize the value of InControl™ from both cost and revenue perspectives. With minimal investment, the pricing model allows service providers to grow their business and generate a recurring revenue stream. Law firms using InControl™ have the ability to control the ever increasing cost of document review. Reveal's pricing structure will continue to respond to the needs of the industry we serve.

## Flexible

InControl™ can mirror the workflow of diverse review projects, allowing administrators to respond to the demands of the case, and users to accomplish their tasks efficiently. Offering the most nimble architecture of its kind, InControl™ allows clients to customize their implementation of the software to meet their diverse needs. Changes can be made during a case as requirements change, and, more globally, across cases – as we know every client and every case has its own unique set of requirements and expectations.

## Easy to Use

InControl™ helps attorneys access information in a fast, user-friendly interface, allowing them to perform their document review as efficiently as possible.

Our software is built with the user in mind – the user interface is intuitive, allowing reviewers to tag, annotate, redact, and produce documents efficiently, and with minimal start-up training.

## Analytics

InControl™ is feature-rich, including our own concept clustering, near duplicate document detection, email threading and quick entity searches for organizing and prioritizing reviews. It also offers advanced search capabilities, and provides alerts for documents with nuances, such as hidden information or track changes or speaker notes.

## Features Users Need

InControl™ has the functionality users need, and provides a high level of flexibility to adapt to the requirements of different projects. Our team of technologists and legal experts work together to design and develop software that meets the demands of the litigation industry. Legal teams have a highly flexible tool at their disposal – with the ability to define tags, assign documents, and lock down necessary functions to ensure a reliable, efficient review.

## Install or Access through a Hosted Provider

InControl™ is entirely web-based software that is offered as an installation or as a hosted solution through a secure data center at one of our install partners. InControl™ can be implemented based on the needs of the organization. In an installed environment, a firm must have the required hardware configuration for the Reveal team to then guide a successful installation, and train your administration team. In a hosted environment, Reveal offers InControl™ through one of our reselling service providers. The technology has exceptional scalability to meet changing project demands.

## Transparent Communication

Use InControl™ to facilitate review project management, using the same technology platform to manage project communication, status, and reporting throughout a project. By keeping communication centralized for the review team, there is one point of reference for relevant project information. Customize reports to keep litigation support staff, attorney reviewers, expert advisors, and vendors up-to-date.

At Reveal, our main concern is providing the most nimble software architecture to our litigation users so that they can accomplish their mission efficiently and effectively. Our technology is flexible and progressive – designed to meet the needs of law firms and corporations on a global level.

Gerry O'Connell, CEO of Reveal

## Secure

Reveal built the most granular level of security into InControl™, such that every task in the system may be locked down. System administrators define user access based on the user's role. The security architecture ensures that individual users are only accessing tasks and data based on their permissions.

## Data in the Cloud

With more data being managed online, Reveal offers an option to control data storage costs. By offloading this data to secure, less expensive, highly available cloud storage, with InControl™, data hosting fees can be significantly reduced.

## Satisfaction

We will support your internal efforts and your clients' efforts to ensure project success and highest levels of satisfaction with the technology. Reveal's expert support team is accessible to all users, from administrators to end users. Our support staff defines itself by responsiveness, resourcefulness, and follow-through. Users receive timely answers, and clear and consistent information that thoroughly addresses their needs. Our goal is for every user to become an InControl™ advocate.
