

## PATENTED SEALING INDICATOR

### A Major Advancement in Packaging Benefits

The patented sealing indicator is a Warning Rim that shows whether or not your correct sized lid is securely attached properly to the cup.

### Patented Sealing Indicator Explained

As you collect your hot beverage from your quickservice outlet you have three observations to be aware of as the Smart Lid changes color:

#### A FULL BROWN RIM

around the lid, signalling complete contact between the lid and cup.

A maintained full dark rim indicates a reduced likelihood of a spillage incident.

#### NO FULL BROWN RIM

indicating steam or heat is escaping from the cup. A hot liquid hazard may be imminent because the uneven rim color indicates the lid and cup are not in full direct contact.

The cup seam is the first place this may occur.

#### RED RIM

a completely red lid warns that the contents are VERY hot and heat transferred has reached all areas of the lid.

If the red rim forms after a full dark rim was showing the lid maybe on correctly but the contents are extremely hot
