

INTRODUCING Ultralam™ LVL for Beams and Headers

- Manufactured with state-of-the-art technology.
- Available in a variety of dimensions.
- Cost effective alternative compared to conventional lumber.
- Environmentally manufactured with virtually no waste.
- High strength and dimensionally consistent.
- Light weight.
- Easy to use with traditional tools.

RICHMOND INTERNATIONAL ENGINEERED WOOD DIVISION

Richmond International Forest Products, LLC (RIFP) was founded in 1982 and is a subsidiary of the Forest City Trading Group, one of the largest wholesale lumber companies in the United States. Our purpose is to bring value to our customers by helping navigate the complicated maze of supply and demand. We pride ourselves on being a full-service company with our customer and mill relationships founded on honesty and integrity.

Throughout RIFP, we have industry experts who know how to help manage market fluctuations, trade and transportation logistics, and credit and fiscal risk speculation. We use the latest technology, and all of our trading is done on-line and in real-time.

Although RIFP started out as a lumber trader only, our new goal is to become the preferred source for the domestic board market. Besides supplying a wide variety of wood products, such as commodity lumber and panels, we also offer: boards, timbers and squares, shop and molding, industrial grade products, stair treads and ponderosa pine. After decades of engineered lumber's proven performance, we're now expanding into this market as well.

NEW VENTURE

Richmond International Engineered Wood Division

Our traditional expertise in supply chain management will ensure on-ground inventory and inbound materials that will meet your demands quickly. The people behind Richmond International Engineered Wood Division have been in the engineered wood business for over 20 years. We provide experience in all aspects of delivering quality products to the end user including: manufacturing, engineering, distribution and retail operations. We offer personalized service to meet your many needs.

We are proud to offer Ultralam™ LVL as our first engineered product line, because the quality,

price, and availability have met our high expectations. This high-strength laminated veneer lumber is manufactured with the most advanced laminated veneer technologies, in an environmentally conscious process that virtually produces no waste.

Current RIFP customers know of our excellent service and can expect the same from the new Engineered Wood Division. We offer our counsel, and unmatched expertise to help you through the ups and downs of a volatile market.

ULTRALAM™ LVL

Modern Lumber Technology LLC produces FSC certified Ultralam™ LVL with the latest state-of-the-art technology. By using the world's largest laminated veneer continuous press and microwave preheating, the bonding quality of veneer sheets is extremely uniform. This highly efficient manufacturing process produces a high strength, cost effective, and easy-to-use engineered wood product.

Once pressed, the over-sized billets are cut into a variety of lengths and dimensions ideal for construction framing as beams, headers, joists, rafters, columns and wall studs. Ultralam™ LVL can also be used in metal-plated trusses and concrete forming.

Coniferous logs

Peeling the log takes less than 3 seconds

Other applications include recreational and manufactured housing, packaging, crating, door, window, and furniture parts. All of these manufacturing components can easily be cut to exact customer specifications.

The manufacturing and quality assurance program is monitored by PFS Corporation, an independent third-party inspection agency. Ultralam™ LVL is produced according to ASTM standards and has been issued an evaluation report (ESR-3147) from ICC-ES.

Manufacturing Ultralam™ LVL has virtually no waste since all of the timber by-products are used to manufacture wood pellets or used as energy to supply the manufacturing facility.

Sheets of veneer go to grading and processing

The Dieffenbacher press is the longest in the world

Quality inspections

Billets are cut, packed, and shipped

DESIGN PROPERTIES

2.0E – 1 3/4" Thick

| Depth (in.) | 5 1/2" | 7 1/4" | 9 1/4" | 9 1/2" | 11 1/4" | 11 7/8" | 14" | 16" | 18" |
|--------------------------|--------|--------|--------|--------|---------|---------|--------|--------|--------|
| Moment (Ft-lbs) | 2,175 | 3,635 | 5,720 | 6,010 | 8,225 | 9,095 | 12,350 | 15,825 | 19,690 |
| Shear (lbs) | 1,280 | 1,690 | 2,155 | 2,215 | 2,625 | 2,770 | 3,265 | 3,730 | 4,200 |
| Moment of inertia (in^4) | 24.3 | 55.6 | 115.4 | 125.0 | 207.6 | 244.2 | 400.2 | 597.3 | 850.5 |
| Weight (PLF) | 2.5 | 3.3 | 4.2 | 4.3 | 5.2 | 5.4 | 6.4 | 7.3 | 8.2 |

Allowable Design Stress (PSI)^{1,2}

| Property | | 2.0E |
|--|-------|-----------|
| Modulus of Elasticity (MOE) | Joist | 2,000,000 |
| | Plank | 2,000,000 |
| Flexural stress-MaR (F _b) ^{3,5} | Joist | 2,650 |
| | Plank | 3,300 |
| Tensile strength (F _t) ⁴ | | 2,100 |
| Longitudinal Shear (F _v) | Joist | 200 |
| | Plank | 150 |
| Compression Parallel (F _c) | | 2,600 |
| Compression Perpendicular (F _c) | Joist | 590 |

1. The allowable design stresses apply to protected, dry service conditions.
2. The tabulated allowable design stresses to the left are permitted to be adjusted for duration of load as provided in the NDS-2005.
3. The tabulated flexural stresses above are permitted to be increased by 4% for repetitive member stresses as provided in the applicable code.
4. The tabulated tensile stress is based on gage length (L) of 3 feet. For other gage lengths, the tabulated tensile stress is adjusted by multiplying F_t by $(3/L)^{0.125}$ where L is measured in feet.
5. The tabulated flexural stresses are based on load of normal duration and a reference depth of 12 inches. For other depths, the tabulated flexural stresses are adjusted by a depth size factor adjustment of $(12/d)^{0.17}$ as shown in the table below.

Size Effects

| Depth (in.) | 3 1/2" | 5 1/2" | 7 1/4" | 9 1/2" | 11 7/8" | 14" | 16" | 18" | 24" |
|---------------|--------|--------|--------|--------|---------|------|------|------|-----|
| 1.8E and 2.0E | 1.2 | 1.12 | 1.08 | 1.04 | 1.0 | 0.98 | 0.96 | 0.94 | 0.9 |

- Spans indicated are clear spans based on worst case for either simple or continuous beam applications.
- Bearings required in inches is indicated for both Bearing (SPF) plates and for Bearing (2) applications on columns. The first number is bearing required at ends of beams followed by bearing required at interior supports for continuous applications.
- For continuous beam applications the shorter span must be longer than 40% of the longer span to avoid uplift.
- Allowable loads shown are in pounds per foot (less weight of the beam).
- Deflection limited to L/360 LL and L/240 TL.
- Continuous lateral support is required on compression edge of beam.
- Loads applied to side of beam must comply with connection and fastener details shown on page 13.

• Only simple beam conditions apply to this chart.

- Bearings required in inches is indicated for both Bearing (SPF) plates and for Bearing (2) applications on columns. The first number is bearing required at ends of beams followed by bearing required at interior supports for continuous applications.
- For continuous beam applications the shorter span must be longer than 40% of the longer span to avoid uplift.
- Allowable loads shown are in pounds per foot (less weight of the beam).
- Deflection limited to L/360 LL and L/240 TL.
- Beam weight not included in LL deflection calculations.
- Continuous lateral support is required on compression edge of beam.
- Loads applied to side of beam must comply with connection and fastener details shown on page 13.

- Spans indicated are clear spans based on worst case for either simple or continuous beam applications.
- Bearings required in inches is indicated for both Bearing (SPF) plates and for Bearing (2) applications on columns. The first number is bearing required at ends of beams followed by bearing required at interior supports for continuous applications.
- For continuous beam applications the shorter span must be longer than 40% of the longer span to avoid uplift.
- Allowable loads shown are in pounds per foot (less weight of the beam).
- Deflection limited to L/240 LL and L/180 TL.
- Continuous lateral support is required on compression edge of beam.
- Values shown in table include a load duration effect of 1.15 to account for snow load. User to verify with local building code.
- Loads applied to side of beam must comply with connection and fastener details shown on page 13.

• Only simple beam conditions apply to this chart.

- Bearings required in inches is indicated for both Bearing (SPF) plates and for Bearing (2) applications on columns. The first number is bearing required at ends of beams followed by bearing required at interior supports for continuous applications.
- For continuous beam applications the shorter span must be longer than 40% of the longer span to avoid uplift.
- Allowable loads shown are in pounds per foot (less weight of the beam).
- Deflection limited to L/240 LL and L/180 TL.
- Continuous lateral support is required on compression edge of beam.
- Values shown in table include a load duration effect of 1.15 to account for snow load. User to verify with local building code.
- Loads applied to side of beam must comply with connection and fastener details shown on page 13.

- Spans indicated are clear spans based on worst case for either simple or continuous beam applications.
- Bearings required in inches is indicated for both Bearing (SPF) plates and for Bearing (2) applications on columns. The first number is bearing required at ends of beams followed by bearing required at interior supports for continuous applications.
- For continuous beam applications the shorter span must be longer than 40% of the longer span to avoid uplift.
- Deflection limited to L/240 LL and L/180 TL.
- Continuous lateral support is required on compression edge of beam.
- Values shown in table include a load duration effect of 1.15 to account for snow load. User to verify with local building code.

- Spans indicated are clear spans based on worst case for either simple or continuous beam applications.
- Bearings required in inches is indicated for both Bearing (SPF) plates and for Bearing (2) applications on columns. The first number is bearing required at ends of beams followed by bearing required at interior supports for continuous applications.
- For continuous beam applications the shorter span must be longer than 40% of the longer span to avoid uplift.
- Allowable loads shown are in pounds per foot (less weight of the beam).
- Deflection limited to L/240 LL and L/180 TL.
- Continuous lateral support is required on compression edge of beam.
- Values shown in table include a load duration effect of 1.15 to account for snow load. User to verify with local building code.
- Roof loads plus two feet overhang assumed to bear on outside walls only.
- Floor loads assumed to be 40 PSF live and 12 PSF dead.

- Spans indicated are clear spans and are worst case for simple or continuous spans.
- Bearings required in inches is indicated for both Bearing (SPF) plates and for Bearing (2) applications on columns. The first number is bearing required at ends of beams followed by bearing required at interior supports for continuous applications.
- For continuous spans the shorter span must be greater than 40% of the longer span to avoid uplift.
- Deflection limited to LL/360, TL / 240.
- Floor Loads are 40 PSF live, 12 PSF dead
- Roof loads are assumed to be bearing on exterior walls only plus 2 foot overhang.
- Beams to have continuous lateral support along compression edge.
- The weight of the exterior wall is assumed to be 80 PLF.

Notes Apply to Both Floor Beam Tables

- Spans indicated are clear spans and are worst case for simple or continuous spans.
- Bearings required in inches is indicated for both Bearing (SPF) plates and for Bearing (2) applications on columns. The first number is bearing required at ends of beams followed by bearing required at interior supports for continuous applications.

- Continuous spans must have shorter span at least 40% of the length of longer span to avoid uplift.
- Tables assume no roof loads. Floor loads are 40 PSF live and 12 PSF dead.
- Live loads reduced per IBC 1607.9.
- Deflection limited to L/360 LL and L/240 TL.
- Beams must be laterally supported along compression edge.

- Interior wall assumed to be 60 PLF.

FASTENERS AND NAILING

Fasteners

| Test | | Nearest SPP Combination Recommended | |
|---|-----------------------|-------------------------------------|--|
| Withdrawal 8d Nail Installed in Face | Withdrawal | Red Maple (0.58) | |
| Withdrawal 8d Nail Installed in Edge | Withdrawal | | |
| Bearing 10d Nail Installed in Face | Loaded in L Direction | | |
| | Loaded in X Direction | | |
| Bearing 10d Nail Installed in Edge | Loaded in L Direction | Western White Pine (0.40) | |
| | Loaded in X Direction | | |
| Bearing Loaded in Parallel Direction | 1/2" Bolt | Red Maple (0.58) | |
| | 3/4" Bolt | | |
| Bearing Loaded in Perpendicular Direction | 1/2" Bolt | Red Pine (0.44) | |
| | 3/4" Bolt | | |

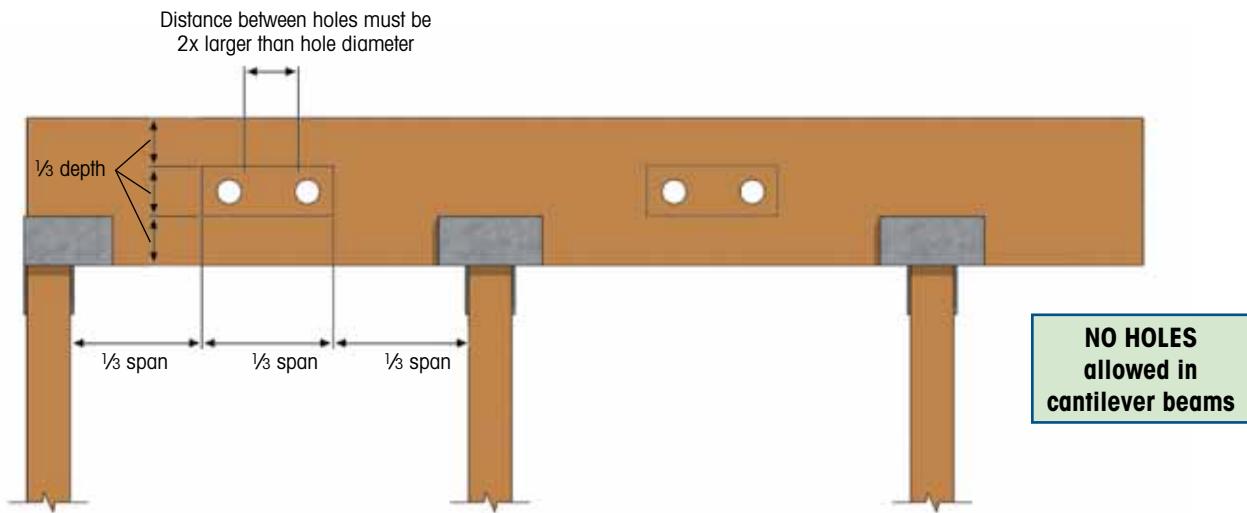

- Allowable values for nails noted in the applicable code are applicable to the Ultralam™ LVL for conditions and species noted in the table.

Allowable Side Loads

| Type of Fastener | Number of Rows | 2 Ply member | | 3 Ply Member | | 4 Ply Member |
|-------------------------|----------------|--------------|------|--------------|------|--------------|
| 10d (.128 x 3") Nails | 2 | 12" o.c. | 300 | 12" o.c. | 225 | N/A |
| | | 6" o.c. | 600 | 6" o.c. | 450 | |
| | | 4" o.c. | 900 | 4" o.c. | 675 | |
| 10d (.128 x 3") Nails | 3 | 12" o.c. | 450 | 12" o.c. | 340 | N/A |
| | | 6" o.c. | 900 | 6" o.c. | 680 | |
| | | 4" o.c. | 1350 | 4" o.c. | 1020 | |
| 1/2" A307 Through Bolts | 2 | 24" o.c. | 415 | 24" o.c. | 310 | 24" o.c. |
| | | 19.2" o.c. | 520 | 19.2" o.c. | 390 | 19.2" o.c. |
| | | 16" o.c. | 630 | 16" o.c. | 470 | 16" o.c. |
| | | 12" o.c. | 830 | 12" o.c. | 620 | 12" o.c. |

- Loads shown are allowable load applied to side of beam, given in Pounds per lineal foot.
- Bolts to have washers. Holes to be pre-drilled to 1/32 to 1/16" Maximum over the diameter of the bolt.
- Specific Gravity of 0.44 used for bolted connections. SG= 0.40 used for nailed connections.
- Values listed are for 100% load duration. May be increased 15% for snow loading and 25% for non-snow roof loads where allowed by code.
- Minimum edge distance for fasteners to be 2". Minimum end distance for bolts to end of beam to be 6".
- Beam adequacy should be checked using PLF or application tables or by design professional.
- When using nails on three ply beams, specified nail pattern must be installed from both sides of the beam.
- For applications outside the scope of this table consult a design professional.

HOLE CHART AND TAPERED END CUTS

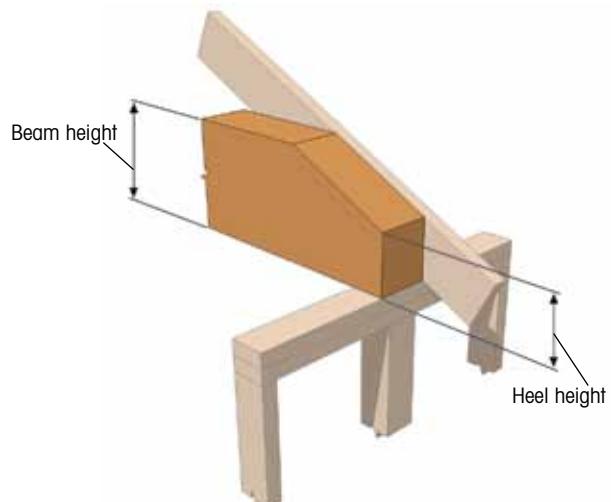

Allowable Holes

- All beams must be in the middle third of the span and in the middle third of the beam depth.
- Holes must have a 2 diameter spacing between adjacent holes.
- Holes should be round and carefully cut to avoid damage to beam.
- Three holes maximum per beam.
- In beams greater than 7½" and where length of beam is greater than 11 times the depth of the beam, an additional 1" diameter hole may be placed in the middle third of the beam and no closer than 6 inches from the bearing.

Allowable Reactions for 3½" Wide Beams

| Beam Depth | Roof Slope | Height at Heel | | | | | | | | |
|------------|------------|----------------|------|------|------|------|------|------|------|------|
| | | 4 | 4½ | 5 | 5½ | 6 | 6½ | 7 | 7½ | 8 |
| 7½" | 4/12 | 2770 | 3175 | 3580 | 3805 | 3885 | 3890 | 3890 | 3890 | 3890 |

| 16" | 4/12 | | | 3575 | 3845 | 4110 | 4380 | 4650 | 4915 | |
| | 6/12 | | | 3620 | 3890 | 4155 | 4725 | 4695 | 4960 | 5205 |
| | 8/12 | 3665 | 3935 | 4200 | 4470 | 4740 | 5005 | 5205 | 5205 | |
| 18" | 4/12 | | | | 4110 | 4380 | 4650 | 4915 | | |
| | 6/12 | | | 3890 | 4155 | 4425 | 4690 | 4960 | 5205 | |
| | 8/12 | | 3935 | 4200 | 4470 | 4740 | 5005 | 5205 | 5205 | |

- Lateral support must be provided at bearing and along compression (top) edge of beam.
- No taper cut is allowed when inside face is less than 40% of beam depth.
- No holes or concentrated loads allowed within tapered cut.
- For 1¾" and 5¼" beams multiply by 0.5 and 1.5 respectively.
- Loads indicated are allowable reaction limited by shear in the beam or by bearing.
- Bearing assumed to be 3½" wide and assumes bearing is on plate material with F_c perp of 425 psi.
- Shear load in beams assumes snow load (1.15 DOL). No increase in bearing stresses for DOL permitted.
- Loads are for vertical downward loads only. Consult a design professional for uplift loads and other conditions.

* Fill all round nail holes with 16d common.

PRODUCT HANDLING AND STORAGE

Proper Product Storage and Handling – Why is it important?

- Customer Expectations** – customers expect quality, visually appealing wood products.
- Structural Performance** – wet, weathered wood products lose strength and stiffness.
- Dimensional Tolerances** – depth and thickness tolerances cannot be maintained on wet, weathered products and compromise the product warranty.

Proper Product Storage – How is it accomplished?

- Tarping/covering is encouraged regardless if the bundle is opened.
- Allow the bottom of the bundle to breathe to avoid greenhouse effects.
- Sticker bundles at approximately 10' on-center, using stickers of appropriate size to insure no contact with ground and/or moisture or have prolonged exposure to the weather.
- Stickers should align for stacked bundles. Stacked bundles should not exceed 10'.
- Store products as shipped in a flat orientation.
- Do not re-wrap wet material.

Proper Product Handling – How is it accomplished?

- Unload products carefully, by lifting with forklifts or cranes carefully to avoid damaging product. Support the bundles to reduce excessive bowing.
- Individual products should be handled in a manner that prevents physical damage.
- Except as described in technical literature, product should not be cut, drilled or notched.
- Product should never be used for unintended purposes such as ramps, storage and walk planks.
- Do not install wet or visually damaged product. Multi-ply products should be dry before nailing or bolting to avoid trapping moisture.
- Temporary construction loads that cause stresses beyond design limits are not permitted.
- 13 1/4" beams deeper than 14" must only be used in multi-ply application.
- Failure to follow proper procedures for handling, storage and installation could result in unsatisfactory performance, unsafe structures and voids the product warranty.
- Avoid handling or walking on wet product – slippery when wet.

Follow these guidelines to ensure quality performance.

General Notes

- Loads should be checked by qualified designer as capacities can vary based on supporting member. Connector capacity may not meet maximum beam capacity.
- Loads listed assume that all hanger manufacturer recommendations for fastener quantity and size are used as well as thickness of member the connector is attached to.
- Some loads may be increased for load duration; refer to manufacturer technical literature for other allowable load durations.
- Hanger information above can be found in each manufacturer's technical literature. For additional information refer to their literature.
- Hanger loads are for HF/SPF or have been adjusted for HF/SPF as per manufacturer's specification. For additional information refer to their literature.

Leading the new Engineered Wood Division is Chad Carnes. His many years and diverse roles in the wood industry have given him insight on building effective business partnerships throughout the entire supply chain.

Chad began his career as an engineer, and soon branched out into various sales and management roles within the ever-changing engineered wood business. Eventually, he was promoted to a Region General Manager with responsibility for a Sales and Customer Service Center that recognized over \$64 million in annual gross sales in engineered wood products.

Later, Chad accepted an executive role with a building materials supplier thus gaining even more valuable experience regarding supply chain and end user needs. Working closely with builders provided the opportunity to analyze channel expectations within the engineered wood products category. Chad expanded his skills when leading business development for a product manufacturer outside of engineered wood – reinforcing how simple, basic values transcend product categories to build the foundation of a valuable supply partner.

Because Chad has gained this vast array of knowledge in supply chain management and end user needs he has made a very clear goal for Richmond's Engineered Wood Division; "Our business will be personalized to meet not only our customer's Engineered Wood needs, but those of their customers as well, all delivered efficiently utilizing the backbone of RIFP's proven delivery system".

Richmond  **International**
ENGINEERED WOOD DIVISION

PRODUCT WARRANTY

Modern Lumber Technologies (MLT) warrants Ultralam™ Laminated Veneer Lumber to be free from defects due to faulty material or workmanship in the manufacturing process in accordance with our specifications.

MLT further warrants that Ultralam™ LVL, when correctly handled, stored and installed, will meet or exceed established design specifications for the normal life of the structure.

Richmond International Forest Products, LLC (RIFP) administers the Product Warranty on behalf of MLT for product sold by RIFP. For copies of the MLT warranty contact RIFP.
