

Cymphonix Internet Management™

Get clarity into and control over *all* Internet traffic

As more mission critical applications and systems are offered as Internet-based utilities or services, the Internet connection has become as important to an organization as telephone service or electricity. Ensuring performance, reliability and security of cloud services such as e-mail and CRM is critical. Regardless of where these solutions are hosted, the common limiting factor is the size and management of the on premise Internet connection.

Cymphonix Solution

Cymphonix® is an innovative provider of Internet management solutions that give organizations clarity into and control over users, applications, web activity, and Internet-based threats. With clarity, the organization gains understanding of how the inappropriate, recreational, relevant and critical traffic types are impacting their organizational objectives.

Successful Internet management requires that each unique traffic type is addressed according to its value to the organization. Policies with limited block and allow options don't offer a framework flexible enough to handle these four traffic types. Policies must give priority to the users, applications and web activity that matter while reducing recreational traffic and eliminating the rest. This results in the desired performance, reliability and security needed to ensure a successful Internet strategy.

Summary

Cymphonix Internet Management solutions help organizations ensure, enable and maximize their investment in their Internet circuits. In turn, using Cymphonix solutions, organizations can improve the performance and reliability of mission-critical traffic while eliminating the risk of inefficiency or failure due to non-critical traffic.

Network Composer EX550

Cymphonix Internet Management begins with the Network Composer appliance.
