

eye guideTM assist

**The World's Most Affordable
Mouse Replacement Technology
for under \$1,000**

Because of a variety of physical limitations, millions of users can't interact with computers as they want or need to do. There are many technology solutions out there to deal with this, but many of the very good ones are cost prohibitive or require users to purchase another computer or even other additional expensive accessories.

EyeGuide Assist has been built to change all this. It is a mouse replacement that everyone can afford to use.

It's affordable.

For only \$749 (US), you can purchase a complete Assist hardware and software solution that works for you right away. That's it. No extra costs, no strings attached, and all future software upgrades are free.

It's versatile.

Assist works on Macs and Windows, and it works with your system's built-in functionality. It doesn't replace; it augments.

It's effective.

Many systems require you to calibrate, and if you lose calibration (which happens a lot), you have to start over. Assist gives you the option to calibrate or use the calibrationless feature.

It's adaptable.

Assist has three built-in ways to click on links, type, or issue other commands: voice command, dwell clicking, or blinking. All of these options can be modified to meet your individual needs.

Assist's headset is also adjustable, so users of all ages--even children--can wear it. It works in all lighting conditions, including outside or in a dark bedroom for late night work. Three rechargeable AAA batteries power everything, which means you can take it with you, even where there's no AC power.

It's user-driven.

We built it for users, by users. If we can make Assist better, we will. Everything we make, users helped us to make it. As EyeGuide™ Assist is used, you'll tell us what you like and don't like. When we can, we'll make improvements, and as long as the software exists, those improvements will be free.

Meet Ryan, Assist's First User

Ryan is intelligent and articulate, but physical limitations keep him from using the computer in ways so many of us take for granted. Until Ryan began using EyeGuide™ Assist, he had to use his chin or hold a pencil with his teeth to click on links or to type. Now, Ryan uses Assist at school and at home for hours at a time to do things he's never done before:

Ryan, his mom (right), and his occupational therapist (left) watch as Ryan plays a game using EyeGuide™ Assist.

complete work in class, play games, read books, and interact digitally with others.

"I love that there are just so many options with how you can customize it and all the different way to access things," said Julie Haverdink, Ryan's occupational therapist. "Now we don't have to worry about hygiene issues with Ryan, and he can do things faster with less help."

EyeGuide™ Assist was developed to bring opportunity to people's lives by enabling them to access computers and interact digitally with others. There's nothing like seeing the smile on users' faces when they use a computer for the first time.
