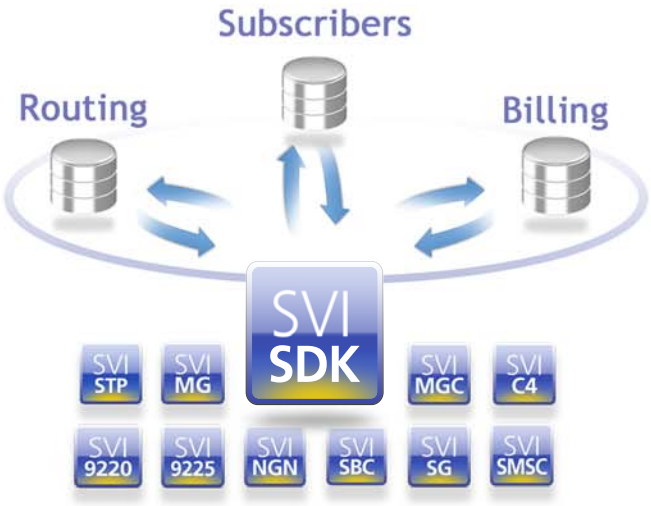
SVI-SDK

SQL Software Development Kit

The SQL Software Development Kit provides clients with a powerful development environment in which to build and deliver their unique services.



Based on industry standerd SQL database technology clients can rapidly manage and build complex service routing logic. The SQL service logic is triggered from any SVI product over a comprehensive SQL-API.

Available across the entire SVI range the SVI-SDK allows clients to not only create database and service logic from scratch but also to integrate with existing routing, subscriber and billing databases.

"We've been using this technology since 2008 - it allowed us to develop the services we wanted to deliver, in the time-frame we wanted to deliver them." - **Bret Mingo, Coretel Networks.**

Why SVI SDK?

- Dramatically reduces time-to-market of new services
- Proven - based on industry standard SQL database technology
- Flexible - integrate with your existing OSS/BSS databases, 3rd party databases or create custom databases from scratch
- Deliver services in-house or use Squire Technologies SQL experts to build and deliver

SVI SDK Package Includes

- Training
- Comprehensive documentation
- Example Code
- Integration support
- Specialist Support
