LeapLock™ Secure Checkout

PayLeap

CHANGING THE GAME FOR PCI COMPLIANCE.

Utilizing LeapLock Secure Checkout technology, PayLeap captures the credit card payment information section and seamlessly embeds it into the end user's browser using an iframe. This information is delivered directly from PayLeap's secure servers over SSL encryption, and applies the same CSS style design of the overall site, or page. This not only helps reduce from PCI scope the hosting environment, network, and application software, but also provides a seamless, branded experience to the end users.

BENEFITS OF UTILIZING LEAPLOCK:

User remains on the host site for payment submission for an optimal user experience.

Sensitive card information section is handled behind-the-scenes by PayLeap for transport and storage.

100% control over user experience is retained by merchant.

Reduces the risk to a company brand which could be associated with a credit card breach.

No disruptive URL redirect for online payments.

Website analytics stats are still in control by the merchant.

No change to alternative payments pages is necessary.

Reduces merchant requirements for PA-DSS certification.

IDENTIFYING THE PROBLEM.

Merchants enjoy the convenience and profitability of accepting payments on their websites, but are also challenged with costs and risk associated with managing the scope of their own PCI compliance. One common way to enable secure online payments is to just redirect users to a standard 3rd party hosted payment page. Although convenient, this method provides the merchant with the least amount of control over the end user experience, including a lack of style and branding.

DELIVERING THE SOLUTION.

PayLeap's innovative hosted payment acceptance method uses a patent-pending secure technology called LeapLock, which creates a branded 'on-demand' secure payment form in the payer's browser. Merchants can now retain control over the end-user experience while also reducing significant risks and costs associated with maintaining a fully PCI-DSS compliant environment.
