

CRYSTAL METH

Crystal Meth is a street drug that is manufactured in illegal labs. Most of the Crystal meth distributed in the United States is manufactured in the U.S. and Mexico. The meth labs in the U.S. are often located in residential neighborhoods and are extremely dangerous. The ingredients used to make crystal meth may contain the following ingredients:

Ephedrine
Drano
Battery acid
Brake fluid
Solvents
Lye
Insecticides

Meth can be smoked, swallowed, snorted or injected. Smoking provides the fastest effect and is the preferred method of most users. The effects of using meth are:

Short Term:

Increased heart rate
Increased wakefulness
Feeling of euphoria
Increased energy
Restlessness and anxiety

Long Term:

Damage to blood vessels to the
brain, leading to stroke,
irregular heartbeat or death.
Liver, kidney or lung damage
Psychosis
Memory Loss
Violent Behavior

Treatment for addiction to Crystal meth is available. Many people recover by entering treatment in a meth rehab. Most treatment programs offer counseling, group therapy, 12 Step meetings rest and nutrition. Help is available for anyone looking for a way to escape this addiction.
