

Poly-Glass® 320 Topcoat

A greener, VOC compliant coating that allows your customer to “shower in 2 hours”.

Poly-Glass 320® underwent rigorous lab and field testing for the last 3 years, passing with high marks and enthusiastic feedback from coatings scientists and customers in test groups alike.

Now NAPCO is very pleased to make it available to all of our customers. NAPCO's new Poly-Glass® 320 line of VOC compliant polyurethane coatings is for use on bathtubs, tile, sinks and countertops.

Not only is Poly-Glass® 320 legal and compliant with the government's stricter volatile organic compound regulation, there's no other coating in the refinishing industry that can compare with Poly-Glass® 320's performance, ease of use and quick turn around time.

This means that NAPCO customers can now advertise they use a new greener coating. It is VOC compliant and is a much better and safer coating for the environment.

Some other advantages are:

- Lower odor coating when being applied means less complaints from your customers.
- Any lingering smell will disappear much faster.
- 50% greater impact resistance than other refinishing coatings means happier customers because this coating will wear better and last longer.
- Higher gloss when applied correctly.
- Dry to the touch in 4-6 minutes at room temperature means the coating is less vulnerable to dust and imperfections than other coatings and less likely to run. It also means you can apply another coat quicker, which shortens time on the job.
- Safer to remove masking paper and caulk sooner than other coatings.
- Put the fixture back in service in 2 hours at normal room temperature. Your customers will love this feature.
- No highly dangerous UV curing needed. No expensive \$2300 UV light. No risk of burning your eyes or skin.
- Using an infrared heat lamp (less inexpensive and safer to use and UV lamps) cures the coating in as little as 30 minutes. Got a run or dust in the finish? No problem! Use an infrared heat lamp or heat gun and fix the imperfection before you leave the job. No more callbacks! This saves time and money.

Refinishers using this coating will not run the risk of fines from using a coating that is not VOC compliant, unlike most other coatings in our industry today.

Because of its low VOC rating, Poly-Glass®320 is quickly becoming NAPCO's fastest selling coating in over 30 years in the chemical & coatings business. You have nothing to lose and everything to gain by trying it today! Ask us for details.
