

LRN/LNP Query Service for Carriers or Service Providers

LRN Based Routing can save carriers and service providers anywhere from 5% - 25% on long distance termination.

Because of LRN, the dialed number may not be the billed number which results in inaccurate routing and billing.

To accurately bill a call, the end user must complete a series of lookups internally before ordering the LCR and routing the traffic. The first step is to perform an LRN Dip and determine the ownership of the telephone number being dialed.

After knowing the billable telephone number, you can perform jurisdictional lookups and then order the LCR of your carriers effectively. Without LRN, at least 20% - 35% of your traffic will be routed improperly.

LRN Dipping is an essential part of Jurisdictional Routing and Rating. If you are inquiring about this service then most likely you already know why you need it and how much it can help you. If you are a bit new to the industry then you might be scratching your head and trying to make sense of it.

Either way, we can help you to either learn more about the importance of LRN or help you to integrate LRN into your platform. Our goal is to help you rate and route ALL your calls properly.

For your convenience you can [email us right from this PDF](#) if you have any questions.
