

# SOLUTION BRIEF

## Fusing Experience and Next Generation Security Monitoring

*"SpyLogix Enterprise brings an interesting twist to the realm of event management. Over the years the traditional approaches of obtaining a holistic view of an integrated platform had been quite challenging. While some products have achieved this to an end, they have done so at the peril of performance due to today's approach of utilizing ODBC or JDBC logging to obtain access to the data. SpyLogix Enterprise takes a new approach by consuming data from native interfaces and employing a streaming messaging platform that is able to consume, analyze, report and repurpose data efficiently - a holistic view of an integrated platform without a performance impact. Its three dimensional visualization capability allows data search and consolidation for the most complicated event messaging queues and fundamentally changes how quickly we can respond to production outages or to surgically identify issues across multiple platforms of an integrated application system."*

*- Andre Maxwell, Principal Information Solutions Xperts*

### Experience

- Architecture Analysis & Design
- Implementation Services
- Capacity Planning
- Continuity Planning
- Performance Tuning
- Disaster Recovery
- IAM SMART

Information Security Xperts [ISX] and IdentityLogix are providing innovative solutions for operational visibility into systems secured with CA identity and access management (IAM) products. Continuous monitoring available through this partnership uniquely complements traditional approaches for tracking operation of CA IAM products by enhancing the efficiency and effectiveness of people, processes and technologies entrusted with keeping business information safe.

ISX brings years of experience designing, building and supporting solutions for securing enterprise business information systems. CA IAM products are used across all industry sectors when sensitive data is made available to users. Experience counts when navigating myriad design choices for supporting millions of users leveraging access to information.

SpyLogix Enterprise software is state-of-the-art security middleware which allows for continuous monitoring, automatic data management and real-time data actualization for information assurance across secure IT infrastructures spanning users, networks, identity and access management (IAM) systems, applications, mainframe systems and cloud or managed services.

SpyLogix Enterprise security middleware software enables efficient management of enterprise information systems. Continuous security intelligence and situational awareness is realizable despite layers of IT system complexity. The use of SpyLogix software enables simplified IT governance by easily handling variety, volume and velocity characteristics of enterprise security data. Data is instantly made manageable, actionable and shareable with other IT services.

### SPYLOGIX ENTERPRISE SpyLogix Modules

- CA SiteMinder
- CA IdentityMinder
- CA SiteMinder Federation
- CA Directory
- CA ACF2
- CA Top Secret

### Security Data Middleware Benefits

- Easily share information, improve security process
- Enhance security vigilance with continuous system monitoring
- Faster "time-to-value" for troubleshooting problems
- Real-time analysis utilizing streaming data
- Richer information provided by native system access
- Manage / control risk with 360° visibility
- Proactive management with automated alerts or actions
