## **Oxygen Forensic Suite 2013 Enhances Android Support, Extracts Data for New Mobile Apps**

Oxygen Software updates its flagship mobile forensic product, Oxygen Forensic Suite 2013, enhancing support for mobile devices running the Android OS and enabling data extraction from mobile apps. The improved Android OS support ensures that no information contained in Android-powered devices will ever escape from the expert's eye.

The improved Android support enables the complete analytics functionality for Android OS archives. Oxygen Forensic Suite 2013 will now display deleted calls and text messages in their corresponding sections, extract names and passwords for memorized Wi-Fi access points, and add support for Android OS .tar and multi-volume .zip archives.

More mobile apps are added to the list of supported data sources. Oxygen Forensic Suite 2013 can now extract information from TripIt free, Skyscanner, the latest versions of VK, Mail.RU Agent and the Japanese version of Yahoo! Meggenger, as well as eBLASTER spyware.

### **Enhanced Android Support**

The newest release of Oxygen Forensic Suite 2013 greatly improves its abilities to analyze information available in mobile devices powered by the Android OS. The tool is now able to automatically recover deleted calls and text messages, displaying them in the corresponding activity sections. Recovered entries are marked with a trash bin icon, allowing investigators to easily identify information that's been deleted by the phone owner.

The updated Android analysis engine adds support for Android OS .tar archives. Multi-volume .zip archives containing the file structure of the device are now also supported.

Finally, the new build can parse information about Wi-Fi hotspots (names and passwords) stored in devices based on the Android OS 4.x. Stored names and passwords to Wi-Fi access points are now displayed in the corresponding Passwords section.

### **Data Extraction from More Mobile Apps**

Oxygen Forensic Suite 2013 extracts, parses and analyzes information from hundreds popular mobile apps, enabling investigators accessing the most complete information about the location and activities of the device owner. The current release adds support for additional applications.

The tool now supports TripIt free for Apple iOS and Android devices, Skyscanner for Apple and Android, the latest versions of VK and Mail.RU Agent (Apple) and the Japanese version of Yahoo! Messenger for Apple iOS devices.

In addition, Oxygen Forensic Suite 2013 can now extract information collected by a widespread spyware application, eBLASTER. Spyware, when installed and active on a mobile device, collects and transmits information about the phone's usage. Oxygen Forensic Suite 2013 can make use of that information for the purpose of conducting forensic investigations, adding support for the many widespread spyware applications.

### **About Oxygen Forensic Suite 2013**

Oxygen Forensic Suite 2013 helps investigators and forensic specialists access and analyze data from a variety of mobile devices such as cell phones, smartphones, communicators, PDA and tablet PCs. Currently supporting more than 6,500 different models, Oxygen Forensic Suite 2013 covers the widest range of mobile devices compared to competition, and allows fully automated acquisition and analysis of supported devices.

The unique Timeline feature offers convenient, single-place access to all activities and movements performed by the user arranged by date and time. Investigators can track user location at every moment, build and map their historic routes, and clearly see all activities performed by the user at each location. Timeline is now available for analyzing DMG images.

Another signature feature of Oxygen Forensic Suite allows investigators to perform a global search on all devices ever analyzed with the toolkit. The global search quickly reveals any connections (e.g. common contacts, exchanged calls, texts or emails) between the phone owners.

Oxygen's statistical analysis tools allow investigators discover social connections between the users of multiple mobile devices. Calls, text messages and Skype conversations are analyzed to produce charts and tables revealing the users' closest circle at a glance.

Oxygen Forensic Suite 2013 guarantees zero-footprint operation, leaving no traces and making no modifications to the content of the devices. This makes it the tool of choice among government and law enforcement agencies, security services, and forensic organizations in more than fifty countries.

## About Oxygen Software

Founded in 2000, Oxygen Software is the worldwide leading maker of the advanced forensic data examination tools for smartphones and other mobile devices. The company is dedicated to delivering the most universal forensic solution covering the widest range of mobile devices running Android, iOS, Blackberry, Windows Phone, Symbian and other operating systems. Law enforcement and government agencies, institutions, corporations and private investigators, help desk personnel and thousands of private consumers rely on Oxygen Software products to ensure evidence availability in the event of mobile device data analysis and recovery. Oxygen Software customers include various US and European federal and state agencies such as the IRS, US Army, US Department of Defense (DOD), US Department of Justice, US Department of Homeland Security, US Department of Transportation, US Postal Service, US Supreme Court, European Commission, London Metropolitan Police, French National Police and Gendarmerie, PricewaterhouseCoopers, Ernst & Young, and many others. As a result, Oxygen Forensic Suite receives great response at forensic conferences, exhibitions and trainings, and occupies a spot on the top of the list in relevant tests for extracting more data than competitors.
