

A Simpler Single-agent IT Environment

vallum

The best way to simplify multi-agent complexity is to reduce the number of agents, and therefore reducing the amount of resource needed to manage multiple complex IT systems. With a single, universal agent, users have the bandwidth equal to that of multiple users managing multiple, proprietary systems with corresponding general management agent interfaces. Vallum's flagship product Halo, is an encrypted network management tool delivered with a universal agent, plus a fully-exposed and documented application interface (API). Halo is free-ware and there is no charge to download and use the product.
