

## Temperature Integrity for Clinical Trial and Drug Development Logistics

# Cold Chain Manager Technology

QuickSTAT's Cold Chain Manager technology helps to ensure product integrity and patient safety by tracking, monitoring and calculating transit duration against a package validation time.

- Cold Chain Manager calculates time elapsed from pack out until expiration to allow for shipment control and early intervention
- Milestones and alarms ensure compliance with specific cold chain management protocols, such as client communication and coolant replenishment
- Real-time shipment control, proactive communication and in-transit intervention help maintain product integrity within Standard Operating Procedures
- Shippers can view the milestones of the transit in real time, to include status of the shipment and an audit-able history of events

Cold Chain Manager is a function of Quick's proprietary IT systems and QuickOnlineRx, the leading online platform for the Clinical Trial and Drug Development industry.
