Introduction

The National Resident Matching Program (NRMP) conducted a survey of all applicants who participated in the 2013 Main Residency Match®. Similar surveys were conducted in 2008, 2009, and 2011.

The primary purpose of the survey was to shed light on the factors that applicants weigh in selecting programs (1) to which to apply and (2) to rank for the Match. The survey was fielded during the 18 days between the rank order list deadline and Match Week so that applicant Match outcomes would not influence respondents' answers.

This report presents survey results by preferred specialty and applicant type. Preferred specialty is defined as the specialty listed first on an applicant's rank order list of programs. Applicant type includes U.S. allopathic medical school seniors and independent applicants. Independent applicants include prior allopathic medical school graduates, U.S. citizen and non-U.S. citizen graduates of international medical schools, students and graduates of schools of osteopathy, students and graduates of Canadian medical schools, and graduates of the Fifth Pathway program.

Changes from Previous Reports

This year, several changes were made to the survey questionnaire. In previous surveys, applicants were asked to indicate factors used in selecting programs for *interview*. In the 2013 survey, the question was changed to factors in selecting programs to *apply*. In addition, a new question was added to this survey asking respondents to indicate factors used in ranking programs.

Structural changes also were made to the questionnaire to facilitate logic and branching. In previous surveys, for example, applicants were asked to rate the importance of each factor in ranking programs, regardless whether each factor was used. In the 2013 survey, applicants could only rank a factor if they had used it in their decision making process. Those changes might result in different overall ratings from the previous years.

Results

Overall, *geographic location, quality, and reputation of program* topped the list of factors that applicants considered most when applying to programs. When ranking programs, applicants also valued such factors as *career path, future fellowship training opportunities, housestaff morale, and work/life balance*. Although there was commonality among all applicants, differences were observed among specialties. For example, applicants who applied to Family Medicine and Internal Medicine programs were more interested in future fellowship training opportunities, while the opportunity to conduct certain procedures was of more importance to applicants to Neurological Surgery programs.

The median number of applications submitted by independent applicants was much higher than for U.S. seniors, but U.S. seniors obtained more interviews than did independent applicants. It also is worth noting that even though matched applicants did not apply to more programs, they attended more interviews and thus were able to rank more programs than unmatched applicants. The greatest number of applications was submitted to Orthopaedic Surgery, Otolaryngology, Dermatology, Plastic Surgery, and Neurological Surgery; however, the numbers of interviews obtained and programs ranked in those specialties were not noticeably larger compared to other specialties.

The NRMP hopes that program directors, medical school officials, and applicants find these data useful as they prepare for and participate in the Match.

The NRMP's data reporting and research activities are guided by its Data Release and Research Committee. NRMP data and reports can be found at: www.nrmp.org/data/ <<http://www.nrmp.org/data/>>.

Response Rates

The overall response rate was 47.9 percent for the 21 largest preferred specialties detailed in this report, and 47.7 percent for all specialties. Response rates varied by specialty and applicant type (see table below). Specialties with 50 or fewer responses were excluded from this report.

	U.S. Seniors			Independent Applicants

†Self-reported data

The boxes in a boxplot represent the interquartile range (or IQR, which is the range between the 25th and 75th percentiles) and the line in the box is the median. The upper bound of the whisker is the upper fence, which is 1.5 IQR above the 75% percentile; the lower bound of the whisker is the lower fence, which is 1.5 IQR below the 25th percentile. The circles below and above the whiskers are outliers. Scales in these graphs are adjusted to show a close-up of the boxplots. Some extreme values and outliers are not shown in the graphs.
