

New LED300 Class III LED Beacons from Checkers create safer work environments.

AID LIGHTS™ LED300 LED Beacons provide exceptional value and superior performance to increase visibility and safety in work areas.

Broomfield, Colorado: Checkers Industrial Safety Products announced the immediate availability of their new AID LIGHTS™ LED300 Class III Beacons. These beacons feature a UV-stabilized polycarbonate dome and four high intensity LEDs that create a highly visible warning for people approaching hazardous areas. They are ideal for construction, traffic safety, utilities, and other environments where people are working around moving vehicles and equipment.

AID LIGHTS™ LED300 LED BEACONS are independent lab-certified to meet SAE J845 Class III requirements and can be used as a steady burn, flashing beacon. With a twist-on dome made from UV-stabilized polycarbonate, these durable lights are built to withstand the harsh weather and working conditions frequently experienced in general industrial applications.

"The new AID LIGHTS™ LED300 Beacon is a perfect solution for industries that need a general duty beacon to create safer working conditions," said Will Eaton, Business Development Manager for Checkers Industrial Safety Products. According to Eaton, "More and more industries are seeing the value of using beacons in their work areas. Many of their needs occur in light to medium duty conditions so they don't require a super heavy duty beacon to get the job done. The LED300 Beacon will certainly provide them the versatility and visibility they need."

Features of AID LIGHTS™ LED300 Beacons include 8 flash patterns (additional flash patterns can easily be programmed), a dual power plug switch that allows users to easily change flash patterns without leaving the driver's seat, and a circuit board protected against reverse polarity. These beacons generate 300 lumens and are available in amber, blue, white, green, or red.

For mounting, AID LIGHTS™ LED300 Beacons come standard with a 3-hole flange with three 12 inch wire pigtails. A magnet base is also available, which includes a 3-hole flange and 40 lb. pull magnet mount with a 15 ft straight cord and 2-way switch power plug. The magnet mount has three Neodymium anti-scratch magnets that are positioned wider on the base for superior holding power while eliminating vehicle scratches and scuffs. An optional 1/2" NPT Pipe Mount is also available as an accessory.

The safety of people and property is the number one priority at Checkers. Checkers manufactures a wide variety of Warning Lights and is one of the world's most trusted resources for industrial safety products. According to Ray Torres, Checkers' President and CEO, "We are committed and focused on educating industries to view safety as an investment and not a cost."
