

Passages is the only enterprise-class browsing solution that enables users to safely browse the Web without being tracked. *Passages* hides your identity so you can't be targeted by hackers or competitors, and creates a secure environment where you are free to browse online without the risk of infecting your machines or compromising your data.

Why *Passages*?

Get accurate information: Many websites block competitor access or manipulate results based on who or where you are. *Passages* is the only enterprise browser that mitigates misinformation because of your identity. Its network of Global IP Hubs allows your users to appear to originate from virtually anywhere in the world, providing access to restricted resources or geographically-targeted information and prices.

All the Web without the risk: *Passages* ensures that any malware attack is isolated within the secure browser and destroyed at the end of your session. It prevents sophisticated targeted attacks by hiding your identity when browsing the Web, and provides a secure file transfer capability. *Passages* automatically scans all downloads and allows users to transfer specifically requested files to their computer.

Monitor your users' activity: Virtualization and various forms of encryption make it harder to properly monitor your users' activity on the Web. *Passages*' oversight tool, *Insight*, captures all of your deployment's web activities directly from the browser, even for secure or dynamic sites.

Preserve your reputation: Users may do things on the Web that could reflect badly on your company. *Passages* helps reduce those risks by ensuring their actions cannot be attributed to your business' network.

Avoid the learning curve: Users can be very resistant to changing their work patterns, but *Passages* is based off of Mozilla Firefox and is nearly identical to the browsers they already use.

Passages
by Ntrepid

Browse from different points of view

Features

Global IP Hubs: Passages' unique network of points of presence, powered by our patented Identity Control* technology, gives users the ability to change their apparent location and view authentic, local web content from anywhere in the world.

Secure Storage: Passages' SafeHold provides users with safe collection and storage of files during browser sessions, including automatic scans for malicious content. Authorized users can download the files to any computer.

Malware Immunity: Every Passages browser instance is unique and runs within its own virtual machine to create a secure online environment that masks potentially identifying attributes, prevents sites from tracking online activity, and isolates all online interaction from the user's local machine.

Enterprise Management Suite: Insight, Ntrepid's comprehensive analytics and managerial suite, provides full audits of all user activity to allow total visibility and ensure compliance.

Intuitive User Experience: The easy-to-use interface is based on Mozilla Firefox, providing a seamless and intuitive user experience with zero learning curve.
