PRESS RELEASE

Yerbabuena Software releases a translation plug-in for Nuxeo

Silicon Valley, February 28, 2013: Yerbabuena Software Inc., the business that created Athento, the smart document management software, is releasing a new translation plug-in for Nuxeo today.

The company has announced that it's making a Nuxeo plug-in for the management of translations on this Enterprise Content Management platform available. Nuxeo is one of the most prominent Open Source code software solutions currently on the Enterprise Content Management market, thanks to its clients in more than 145 countries.

The people who are most helped by the release of this plug-in will be Spanish-speaking users, since the plug-in improves the Spanish translations available for the interface that Nuxeo currently uses. Although Nuxeo has had the help of a Crowdin project, where users can collaborate on translating the platform, the Spanish translation available through Crowdin is only 66% developed.

The plug-in is available for Nuxeo versions 5.4.3 and after, and provides benefits such as:
- **Improvements to the available translations**, especially Spanish translations.
- **The Events tags** (which, by default, did not already come translated on the platform) have been translated.
- **New languages** have been included.

Another of the advantages of the translation plug-in is that it's very easy to install. It's located in a specific path in Nuxeo, and the only action needed is to re-start the server.

The code for the translation plug-in is available from the company's repository on GitHub and can be accessed freely and for free. This plug-in has been developed following the OSGi model.

With an outstanding track record in the development of document management software, and which has become the partner of large suppliers of ECM software such as Nuxeo and Alfresco, Yerbabuena Software is currently focusing on developing its own smart document management product, Athento, which is compatible with the above-mentioned platforms, and also works with SharePoint, Open-Text and Documentum. Athento **Smart Document Management** incorporates leading-edge technology such as Machine Learning, Semantics and Image Processing to automate processes related to work on documents. Athento helps businesses automate processes related to the capture, management, storage and delivery of documents. With Athento, a company can get the traditional functionality offered by a document management system, as well as all the functionality of a capture system; and, with modules, also cover needs of delivery, storage, records management and BPM.

About Yerbabuena Software Inc.:
Yerbabuena Software is made up of a large group of document management software experts and currently has offices in Spain and Silicon Valley, California, in addition to important partnership agreements in countries such as Spain, Argentina, Chile, Peru, Colombia and Mexico. Its Athento product manages documents in businesses such as the DIA group, BNP Paribas or Leroy Merlin.
