

The most advanced software for online data backup and recovery

OSP EVault software is a proven, reliable, disk-to-disk backup and recovery solution trusted by customers globally to protect mission-critical data and keep their businesses running. Advanced, patented technology ensures that you can securely protect a growing, heterogeneous and geographically dispersed network using one, simple solution.

Ensured data availability and recoverability

OSP EVault Software assures that you can meet your growing business and regulatory demands for data availability and recoverability. There's broad support for operating systems and platforms, and it's easy to back up and recover critical data within individual databases, mailboxes, or cluster nodes, using OSP EVault plug-ins for Microsoft Exchange, Microsoft SQL Server, Microsoft SharePoint, Microsoft Cluster Services, and Oracle. OSP EVault's SinglePass technology rebuilds backups dynamically, so there's no need to restore from multiple incremental backups.

Scalable and efficient

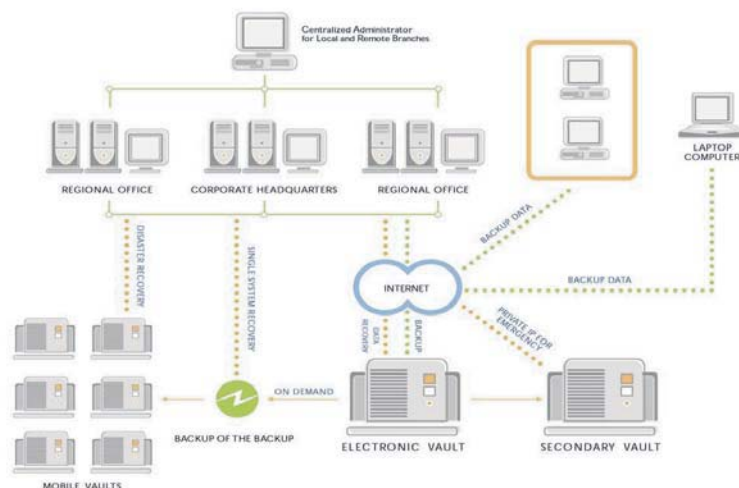

OSP EVault readily scales to accommodate your company's growth, and provides a compelling ROI. You can easily and efficiently manage multiple terabytes of backup data. EVault DeltaPro™ technology speeds your backup operations and dramatically reduces storage costs by backing up only new and changed data blocks. All data is compressed before being transferred, dramatically reducing your storage footprint and backup windows. Data de-duplication decreases this further by eliminating duplicate data within storage. Open files are backed up seamlessly, and variable bandwidth throttling ensures protection without interrupting operations.

Tapeless solution reduces risk

Ending your reliance on tape for backups eliminates time-consuming manual processes, errors, and vulnerability. Your IT staff is freed to perform more productive tasks.

OSP EVault Architecture

The Vault Manager receives the change file from each server, catalogs the file based on its date/time stamp, and stores it in the vault. The Vault Manager continuously monitors the progress of scheduled backups. Anytime the Vault Manager detects an irregularity, it immediately sends an exception alert via email to the system administrator.

KEY BENEFITS

- Superior performance and reliability
- End-to-end data security
- Automated, scalable deployment
- Regulatory compliance
- Assured disaster recovery
- Broad platform support
- Easy data center and network edge protection

End-to-end data security

Data is encrypted before and during over-the-wire transmission, and remains encrypted in storage. During restores, decryption occurs only when the encryption key holder enters the correct passcode. There are no “back door” decryption keys.

Web-based centralized management for distributed environments

OSP EVault simplifies data protection across networks, including remote offices. You manage and monitor your backups through a secure centralized interface, accessible from anywhere with a web browser. Wizards ease setup and administration, and a dashboard confirms that backups occur as expected. Customizable views make it easy to manage agents, and role-based user access lets you delegate backup tasks. To facilitate large deployments, you can apply backup settings from one system to a group of agents.

Compliance with industry and corporate governance requirements

OSP EVault disk-to-disk technology makes it easy to comply with regulations for confidentiality, accessibility, and secure storage. An intuitive interface lets you configure retentions flexibly to satisfy your company’s governance policies for data retention. Support for WORM storage further protects your data, and tiered storage capability lets you migrate seldom-used data to lower-cost media.

Broad platform support

You can use OSP EVault in nearly any combination of platforms and applications including Windows, Novel NetWare, Linux, Sun Solaris, HP-UX, IBM AIX, IBM System i, VMware Microsoft SharePoint, Microsoft Exchange, Microsoft SQL Server, Microsoft Cluster Services, and Oracle. This is not only easy, but cost-effective: A single solution unifies data protection across your entire enterprise.

Feature	Benefit
Automated, disk-to-disk process	There are no tapes to manage, so you save time and virtually eliminate errors.
End-to-end encryption	Encryption is available transit <i>and</i> in storage, ensuring the security of your sensitive data.
Delta processing	EVault DeltaPro™ technology backs up only the data blocks in new or changed files, resulting in significantly faster backup times and minimal backend storage.
Data de-duplication	Eliminates duplicates within backup jobs. Reduces your storage footprint, thereby increasing your ROI and helping you manage data growth.
Single pass restores	Builds complete backups dynamically. You restore in just one step.
Tiered storage	Reduces administrative complexity and TCO by automatically moving long-term backup data to more cost-effective storage tiers. Quickly access data to respond to e-discovery requests.
Web-based, centralized management	Manage your backups from anywhere with a browser.
Broad platform support	Cost effecting by allowing you to use one solution to protect multiple platforms and applications, including Microsoft Windows, Novell NetWare, Linux, Sun Solaris, HP-UX, IBM AIX, IBM System i, VMware, Microsoft SharePoint, Microsoft Exchange, Microsoft SQL Server, Microsoft Cluster Services, and Oracle.
Hot backups	Supports 24 by 7 operations by backing up mission-critical applications while they are online.
