Granco Clark Supplies Signature Aluminum a profile and billet taper quench.

Belding, MI – Signature Aluminum Canada located in Pickering, Ontario has selected Granco Clark to supply performance upgrades to their existing 3000 Ton extrusion line. Signature is upgrading the press line to improve process control and increased capacity.

Granco Clark is supplying a profile quench and a billet taper quench. The profile quench will provide production consistency with excellent metallurgical properties. The taper quench will allow for isothermal extrusion while maintaining extrusion speed throughout the entire extrusion cycle without compromising product quality.

Founded in 1947, Granco Clark began manufacturing billet furnaces and has evolved into a worldwide, cutting-edge, single-source supplier and leading equipment manufacturer in the aluminum extrusion industry.

With a proven track record of manufacturing the most dependable and durable equipment in the business, Granco Clark continually develops groundbreaking technology to improve its products – ranging from billet log furnaces, hot log saws, FusionBond™ to age ovens and stacking equipment.

The company was the first to introduce the integrated control system technology that has since developed into SCSExtrude – the next-generation technology for optimizing automated extrusion line performance.

Another key to Granco Clark's success is listening to customers and designing products for their specific needs. The end results are improved productivity, energy conservation, waste reduction and cost savings for customers.
