

Threema Takes Secure Messaging to the Next Level

Now Optimized for Intel® Atom™ Processor-based Tablets for Android*

Everyone wants their communication to be protected, but most users don't know that they are vulnerable in the first place. The Threema mobile messaging application solves the unseen privacy problem for users before they encounter it. Newly optimized for Intel® Atom Processor-based tablets for Android*, this revolutionary app offers extensive protection for a wide range of mobile mediums.

Asymmetric, end-to-end encryption effectively caps communication on text messaging, chats, photo and video, group chats and GPS location so that all transmissions are secure. An additional encryption layer providing Perfect Forward Secrecy (PFS) ensures that the meta data (information regarding who communicates with whom) cannot be intercepted during transport. This prevents eavesdropping. Once a message is successfully sent, the server deletes it, both confirming its delivery and maintaining confidentiality. Contact lists are verified and integrated so that unidentified callers or third party communication is inhibited.

The app also allows users to adjust their USB storage capacity and extend functionality by adding plug-ins and local files are also encrypted. The user-friendly interface makes it simple to add or remove accounts, modify contact lists and activate address book synchronization, all while closely preserving personal information.

Threema Offers Secure and Easy Communication on Android* Tablets

Now mobile device users can convey their private information and expression with this elastic and powerfully protected tool. The lightweight design and responsiveness of these tablets allow for hours of functionality and coupled with the Threema app facilitates fast, secure messaging through a variety of mediums.
