DRIVING THE SWITCH:

Each RF path can be closed by applying Ground to the corresponding "drive" pin. Any non-driven path will be simultaneously opened by internal logic.

Standard drive:

- Connect pin 15 to ground.
- Connect pin 1 to supply (+20Vdc to +32Vdc)
- Select (close) desired RF path by applying Ground to the corresponding "drive" pin (Ex: apply Ground to pin 3 to close RF path 1).
- To select another path, ensure that all unwanted RF path "drive" pins are disconnected from Ground (to prevent multiple RF path engagement). Apply Ground to the "drive" pin which corresponds to the desired RF path.
- To open all RF paths, ensure that all RF path "drive" pins are disconnected from Ground. Complete the operation by applying Ground to pin 16.

Break-Before-Make

Open the undesired RF path. After 15 mS (minimum), close the new RF path.

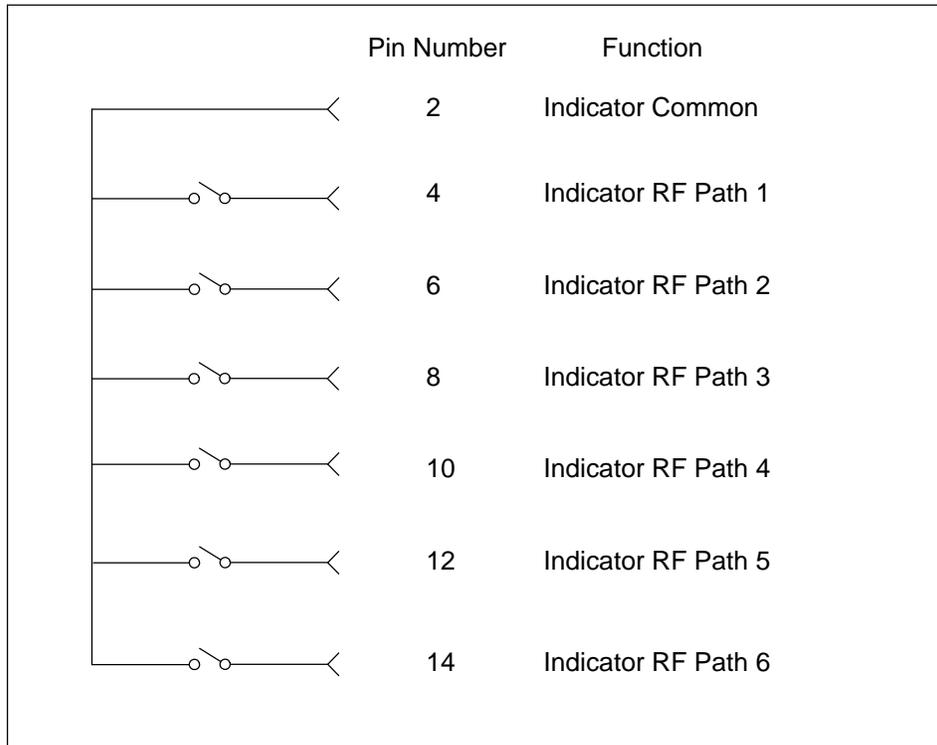

Make-Before-Break

Ensure that the previously selected RF path "drive" is connected to Ground, then close the new RF path. The previously selected path can then be de-selected.

ELECTRONIC POSITION INDICATORS:

The electronic position indicators consist of optically isolated, solid state relays which are driven by, photo-electric sensors coupled to the mechanical position of the RF paths moving elements. The circuitry consists of a common which can be connected to an output corresponding to the selected RF path. If one or more RF paths are closed, the corresponding indicators will be connected to the common. The solid state relays are configured for AC and/or DC operation. The electronic position indicators require the supply (20 to 32 Vdc) to be connected to pin 1 and Ground connected to pin 15.
