

Swift and Thorough Security with the Dr. Web V.9 Anti-virus App by Doctor Web, Ltd.

Now Enabled for Intel® Atom™ Processor-based Tablets for Android*

A new class of device security is now enabled for Android* tablets powered by Intel® Atom™ Processors. With the real threat of invasive viruses becoming more prominent, the Dr. Web v.9 Anti-virus application performs a variety of automated and custom processes that safeguard user data and operation.

Offering fast and efficient scans on whole systems or customized file and folder scans, the app can detect potentially harmful malware utilizing unique Origins Tracing™ technology. This powerful tool identifies an unfriendly program and isolates it in quarantine where it can be assessed and restored if necessary. SD cards receive extensive protective protocols against autorun files, which jeopardize Windows* software. It can even neutralize locker ransomware and restore devices that have been compromised by ransomware.

Another remarkable feature the app offers is the ability to remember statistics on detected threats and the actions taken, so that app is actually “learning” how to better defend against viruses. The Dr. Web v.9 Anti-virus app functions with minimal impact on system performance and economizes battery life for overall smoother operation.

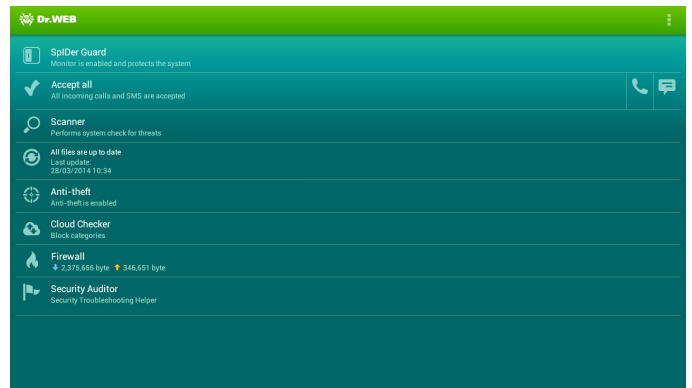

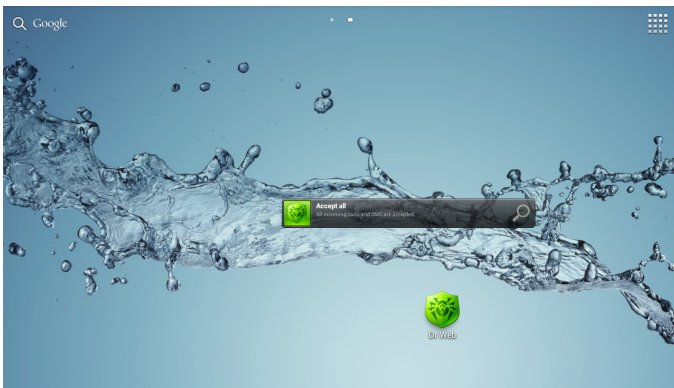

Tablets Get Solid Security with Dr. Web V.9 Anti-virus

As mobile technology advances, so does the danger of invasive malware. With the reinforcement of cutting-edge protection, users can remain confident that their devices are safe. The combination of Intel Atom Processor-based tablets for Android* with the trusted shield of Dr. Web v.9 Anti-virus assures efficient functionality on-the-go.

Features of Dr Web V.9 Anti-virus for Intel Atom Processor-based Tablets for Android*
