# Intellimas® Reporting

It seems that one of the last things that gets addressed in the implementation of large applications is reporting. Project managers secretly hope that out of the box reports will suffice, but they rarely do. Whether you call it business intelligence, dashboarding, or reporting, business clients want their data presented in a variety of formats, and at their fingertips when they need it. The challenge is to be able to create reports that provide actionable intelligence, without having to rely on a programmer.

Singletree Technologies' Intellimas® Reporting is a tool that fits the bill. It can connect into just about any database driven application. Its data source architecture allows for data fields, table relationships, and calculations to be determined up front so that power users or IT staff can easily create reports when they need them. Image oriented presentation reports, listings, charts, tech packs, and excel exports can be created with one tool. Let your reporting strategy become a welcomed addition to your project with Intellimas® Reporting.

Features:
- Drag and drop field placement
- Unlimited formatting options
- Data sources contain all necessary database information
- User report feature allows you to create report groupings and unlimited filtering options
- Report scheduling

Benefits:
- No need to rely on a programmer once the data sources are built
- Pre-defined data sources for some applications
- No need to access server during report deployment
- Client driven reports drive up the user acceptance of any software implementation.
