

PUTTING YOUR DATA TO WORK FOR YOU

Introducing Mammoth Data:
A New Kind of Big Data Consultant

ABOUT US

WHO ARE WE?

Every company wants to be “data-driven.” Problem is, getting to that point isn’t easy. Having information is one thing ... having *useful* information is another.

That’s where Mammoth Data (formerly Open Software Integrators, or OSI) comes in. We’re Big Data consultants who specialize in helping large and mid-sized organizations actually use what they already have. By combining technologies like Hadoop with a high-level strategy, we’re able to craft systems that capture, organize and make actionable massive amounts of your organization’s data.

Basically, we turn your unstructured information into real business intelligence.

Mammoth Data specializes in distributed frameworks and NoSQL databases, like Hadoop, MongoDB and Cassandra.

A Different Kind of Big Data Consultant

WHAT MAKES MAMMOTH DATA DIFFERENT?

If you're in the market for what we do, there's a good chance you've heard that last page before. What makes Mammoth different is ... well ... us. We don't obfuscate, equivocate or be anything other than completely transparent. Big data consulting projects are big undertakings, involving relatively new technologies. That means some level of risk is inherent to the process. To mitigate that risk, everyone involved – us, you, end users, everyone – needs to be on the same page, with the same expectations and the same goals. We call it taking the BS out of BI.

At Mammoth, we're focused on the long run – how well our solutions work for both business and IT users on Day 2 ... and Day 200.

WHAT TECHNOLOGIES DOES MAMMOTH DATA WORK WITH?

Mammoth Data specializes in distributed frameworks and NoSQL databases, like Hadoop, MongoDB and Cassandra. These tools – combined with the experience and expertise of our team – allow us to cost-effectively deploy highly scalable, sustainable solutions.

“BUT I DON'T HAVE ‘BIG DATA!’”

Turning data into actionable information is a pain point for companies of all sizes. The technologies and strategies we use to handle massive amounts of data are equally useful for analyzing relatively small amounts. We're happy to advise companies on sustainable practices and data architectures – “Big Data” or not. Sometimes an existing database system is sufficient; sometimes a more comprehensive architecture is needed. Either way, we can help you become more efficient, more productive and more profitable.
