

# Real-time Reporting and GPS Tracking

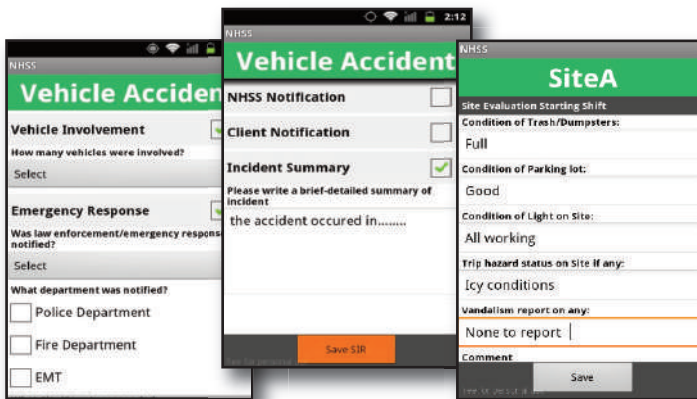

## Transforming Security as You Know It.

OfficerTrax™ is modernizing security by putting security management at your fingertips. It is a customizable mobile application that provides real-time reporting, patrol monitoring, and GPS tracking to enhance transparency and speed decision making.

New Horizon Security developed OfficerTrax™ to fill the void left by readily available commercial-off-the-shelf solutions. We combine the best aspects of existing technology with new capabilities to create this one-of-a-kind solution that can be tailored to your needs. And, with a cloud-based server, your data is always readily available and secure.

### Real-Time Reporting

OfficerTrax™ automates reporting with real-time special incident, daily activity, and facility assessment reports. During patrol rounds or when special incidents occur, OfficerTrax™ automatically prompts the security officer to answer site-specific questions. OfficerTrax™ instantly generates and sends typed and spell-checked reports so you have information fast.

OfficerTrax™ puts security in the palm of your hands. With real-time site and maintenance inspection reports, you can respond to safety assessments proactively versus reactively.

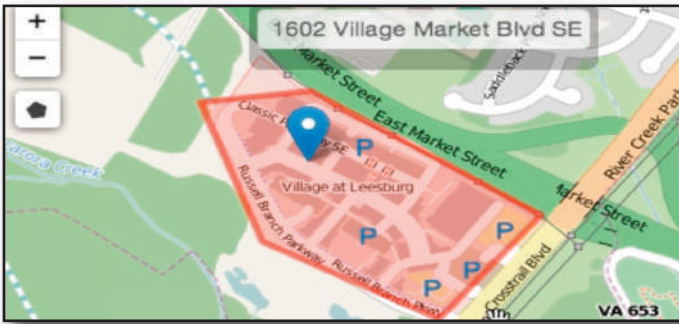

OfficerTrax™ provides instant typed, spellchecked and standardized PDFs uploaded to the client portal, which can be accessed 24/7.

*Security oversight made easy with OfficerTrax™. Define boundaries and track where, when and how often your New Horizon security officers are patrolling your property—all just a click away.*

## GPS Tracking

GPS Tracking is more than just a locator tool. It gives you the ability to "see" exactly where your security officer is operating without leaving your office.

New Horizon's supervisory team draws a geo-fence around the boundaries of your site. If the security officer moves outside the geo-fence boundary, or fails to move within a standard patrol timeframe, OfficerTrax™ automatically sends a notification to our supervisors and live dispatcher operating 24/7. The security officer is called to investigate the alert.

Our clients have online access to this information around the clock. Simply login to OfficerTrax™ and the dashboard will display the current GPS location and geo-fence for each of your sites. If you want more information, click on a site to bring up historical tracking.

## Electronic Post Orders

With OfficerTrax™, site post orders are at the security officers' fingertips. Anytime and anywhere, our security officers can retrieve their post orders along with any unique instructions, eliminating the possibility of guesswork.

### OfficerTrax™ Provides:

- Transparency through instant web-based access
- Efficiency with real-time customized reports (daily and special incident)
- Rapid response via live monitoring and 24/7 dispatch
- Integrated GPS tracking, QR codes and geo-fence technologies
- Data security and availability using cloud-based server

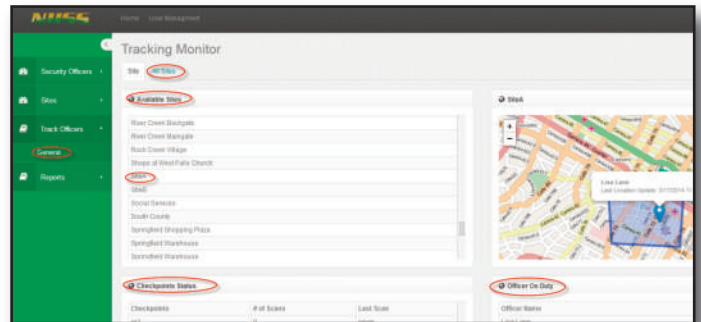

## Patrol Monitoring Using Scannable Checkpoints

OfficerTrax™ provides instant access to patrol tracking monitoring information. There is no special wand and no metal tags like with traditional patrol monitoring systems. OfficerTrax™ uses QR scanning software to register security checkpoints during security officer patrols. Small QR codes are placed in strategic locations throughout your site. We work with you to determine the appropriate number of checkpoints and frequency of patrol rounds.

During each patrol, the security officer scans the QR codes with the site smartphone.

The OfficerTrax™ dashboard shows you the historical progress of each patrol, the number of times each checkpoint is scanned, and elapsed time since the last scan.

## Transform Your View of Security

With OfficerTrax™, you control access to information, as well as what you receive and how often. Fully customizable to each property, OfficerTrax's™ daily assessment questions are tailored not just to your industry—property management, healthcare, education, government, critical infrastructure—but also to your individual site.
