

# Introducing Desktop as a Service from City Network

---

Today City Network, one of the fastest growing IaaS providers in Europe, announces the launch of a new service for the enterprise market. With Desktop as a Service (DaaS), customers can give their employees secure access to their unique desktop configuration and apps from any hardware platform as they work in a completely cloud based desktop solution.

By optimizing companies' investments in hardware for end users, as well as enabling centralized distribution of updates and patches, DaaS from City Network will save both time and money for any organization.

– These days, employees count on being able to reach their data from any device at any time, says Johan Christenson, CEO of City Network. For the IT department this means increased administration costs. At the same time securing data becomes more demanding when users mix private and work related data. This is why we release our streamlined and cost effective Desktop as a Service.

Desktop as a Service is now available for all users of City Network's IaaS City Cloud. Companies can ensure that corporate information is stored in a location of their preference, regardless of where the user is located at the moment. Customers get a customized solution based on their needs. The service supports a number of platforms from start, among them iOS, Android, Windows, MacOS and BlackBerryOS 10.

– This is the first product derived from our initiative towards enterprise customers that we introduced earlier this year. We see an increased demand for cloud-based services, says Johan Christenson.

Desktop as a Service is delivered and adapted to client needs. The price range is between \$10-\$20 per month and desktop depending on graphics performance for each user.

## About City Network

City Network is a provider of infrastructure services with presence on several European markets. With a main focus on availability and open platforms, City Network is a secure and flexible partner for businesses that aim to build, extend or migrate to a cloud-based infrastructure. Innovation and development are at the core of City Network. The company's cloud offering, City Cloud, is the first OpenStack-based, multi-location IaaS in Europe. City Network has over 25000 customers worldwide.
