SNBL CPC Completes Enrollment of their Fourth Japanese Bridging study

BALTIMORE, M.D., Nov. 30, 2015 (PR WEB) – SNBL Clinical Pharmacology Center, Inc. (SNBL CPC), a 96-bed clinical pharmacology research unit specializing in complex phase I/II clinical trials, announced today the successful enrollment of a fourth Japanese Bridging study, investigating the pharmacokinetics and safety parameters of an investigational product under an IND application.

The study that recently completed enrollment was a single dose crossover study evaluating the intra-protocol pharmacokinetics, safety, and tolerability of the IP in 10 healthy adult Japanese male and female volunteers, and 10 healthy Caucasian male and female volunteers. All of the volunteers were enrolled into the study meeting timeline goals set by the sponsor. This achievement is highlighted by the fact that protocol entry criteria for Japanese ethno-bridging clinical trials are much more stringent today than in the recent past, verifying that SNBL CPCs recruitment strategies and access to patients is very effective.

SNBL CPC is an American subsidiary of Japan's first early phase contract research organization, Shin Nippon Biomedical Laboratories (SNBL). Thanks to its Japanese roots, SNBL CPC is well-positioned to provide Japanese-style amenities and support to ensure appropriate care of Japanese subjects during these trials. Native-born Japanese-speaking support staff include a research physician who has been with SNBL CPC since 2006, a research nurse and several translators who assisted with recruitment and clinical conduct. Feedback from Japanese participants regarding their experiences throughout the trial has been positive, demonstrating the success of SNBL CPC's approach to providing Japanese-style care.
