# Do more dentistry

## Without adding more chairs

Teledentistry lets you see patients and advise them on the care they need, regardless of their location - and without leaving your office. Plus, patients who are seen via teledentistry are more likely to come in for treatment.

Using the **MouthWatch intraoral camera, tablet and TeleDent™ platform**, your hygienist or a patient's caregiver can easily obtain and share live streaming or "store and forward" diagnostic images, videos and documentation, allowing you to remotely conduct an evaluation and recommend next steps.

Seeing patients with TeleDent™ is not only easy, it's efficient and profitable. In fact, your hygienist can easily see multiple patients at a remote location which then turn into evaluations for review and potential in-office patients. And more and more insurance plans are providing attractive reimbursement for teledentistry evaluations, consultations and intraoral images.

# TeleDent is the easiest way

## to offer teledentistry

Until now, implementing teledentistry required a complicated patchwork of software, computers and networking expertise - along with the patient, document and image management tools often required by state regulations, all of which needed to be HIPAA-compliant.

MouthWatch TeleDent is a turnkey platform that makes teledentistry easy, effective and affordable.

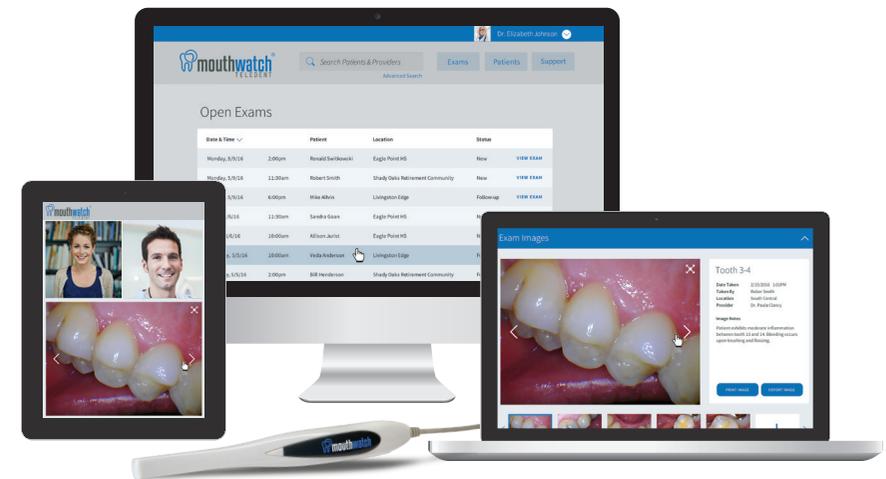

With your staff in the field, you can efficiently review evaluations, provide live consultations and track everything you need for reimbursable teledentistry. All in an easy to use, HIPAA-compliant system. With just our tablet, intraoral camera and TeleDent software — and a dentist with access to a web browser, you can vastly increase the breadth and efficiency of your practice.

## Teledentistry Benefits Are Clear

Implementing a teledentistry program for your practice can help improve many aspects of the care you provide and your bottom line.

TeleDent makes it easy for your practice to:

- ✓ Attract new patients without taking up chair time or resources
- ✓ Increase revenue streams for dentists and hygienists
- ✓ Provide profitable, convenient outreach to your community
- ✓ Convert teledentistry evaluations into in-office treatment
- ✓ Offer convenient, no-transport oral evaluations
- ✓ Convert efficient screenings into productive appointments
- ✓ Improve claim support and documentation
- ✓ Benefit from increasing teledentistry reimbursement

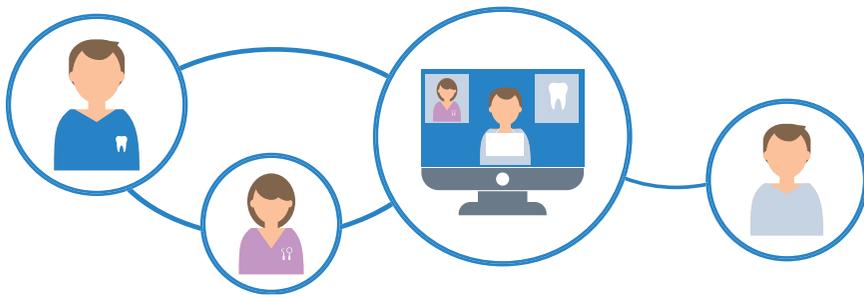

*TeleDent is optimized for easy capture and sharing of patient information and diagnostic imaging using just a tablet computer and intraoral camera. Evaluations can be shared with a remote dentist for later review or live-streamed for an interactive video consultation with the patient and on-site professional.*

# How Does TeleDent Work?

Using the MouthWatch TeleDent™ remote unit, which consists of our intraoral camera and the local TeleDent™ application loaded onto a tablet computer, your hygienist, auxiliary or even a patient's caregiver can easily record patient demographic information, health history and any relevant documentation.

Once the patient is set up, the team member begins a visual inspection of the patient's mouth using the intraoral camera, taking photos and videos to share with the reviewing dentist. Each patient session is automatically labeled and dated, and is always accessible via web browser from our secure HIPAA-compliant cloud servers. Your team can also import any x-rays or photographs from other images sources into the patient exam. Images, notes and billing codes can be migrated to your practice management software at any time.

## Store and Forward? Live Streaming?

You have two options for how and when you want to review the remote patient's images. "Store and Forward" (or asynchronous) describes technology that captures patient data at one site, then uploads it to the cloud to share with a professional at another site for later review. "Live streaming" (or synchronous/interactive) describes simultaneous two-way live video and audio.

Of course...TeleDent does both. So your team can share patient data for a dentist to review at a time that works for them, initiate a live consult where you can "meet" a patient and see intraoral images in real-time.

# The Economics of Teledentistry

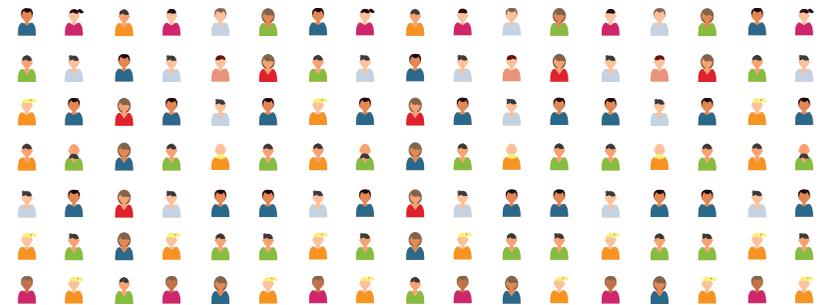

Seeing patients with TeleDent™ is not only easy, it's efficient and profitable.

Practices can earn additional revenue through teledentistry in several ways:

- ▶ **Track billing codes** for any services provided at a remote location. A growing number of states and payers provide reimbursement for both store and forward and/or live streaming evaluations. To make record-keeping easy, TeleDent allows for easy documentation of dental services and providers.
- ▶ **In-office treatment** for conditions discovered via teledentistry screenings. Studies show that patients are 50% more likely to visit a dental office when they have had a teledentistry consultation explaining the need for treatment.
- ▶ **Maximize your hygiene department** by reaching populations that require care but can't easily access treatment. Through on-site care and in-office visits, these new patients require preventive care and restorative treatments with a range of reimbursement methods.

Additionally, patients who come to your office for treatment are likely to come back and even bring family members.

Your office is now much larger, with a single, turnkey system

# Teledentistry and its role in your community

Your practice can play an even more important role in improving oral health in your community by offering teledentistry services at schools, managed care facilities, private and public community clinics and many other locations. And the need for teledentistry is huge.

- ▶ 100 million Americans have not seen a dentist in at least a year
- ▶ 27% of adults over 20 years old have untreated caries
- ▶ Over 40 million Americans say the main reason they haven't seen a dentist is due to "not having time"
- ▶ 4,230 Dental Health Professional Shortage Areas have 49 million residents
- ▶ 59% of seniors living in managed care settings have untreated decay

**Studies have found that diagnosis of caries via teledentistry is as reliable as visual/tactile examination.**

# What's included when you get TeleDent

Each TeleDent™ system comes with everything you need for teledentistry.

One year subscription to TeleDent™ software (pricing based on number of providers)

Store and forward plus live streaming technologies

10.1" Windows Tablet PC with integrated webcam

MouthWatch Intraoral Camera

One year warranty on all hardware

Staff training, onboarding and support

**TeleDent by MouthWatch** will change everything you thought you knew about teledentistry.
