

PRESS RELEASE – FOR` IMMEDIATE RELEASE

myHealth Sentinel launches the first Telehealth Big Data Analytics - myQ Decision Support

Singapore, July 4, 2016 – myHealth Sentinel (mHS), a leading cloud-based Telehealth Service Provider, is delighted to announce the launch of its Telehealth analytic product “myQ Decision Support”. This is the result of a partnership with “QSpectral Systems an Australian based data science company delivering innovative analytics for industry.

“myQ Decision Support” (mQDS) is being offered as a value-added option for mHS’ “TeleMetrix+” (TM+) telehealth service. mQDS enables clinicians to leverage machine learning and AI-powered analytics to the biometric data being collected by TM+. This will permit more comprehensive clinical insights to better tailor, management and provide predictive indicators for patients at risk for early intervention.

Implementation of mQDS involves the development of custom analytic models designed to determine the probability of specific clinical outcomes and rank their urgency. TM+ data, together with multiple other sources of patient clinical data can be blended to enhance the predictive accuracy of the mQDS analytic models.

“mQDS is the next step-up the value chain for our growing base of clients” said Mr. William Chew, Managing Director and co-founder of myHealth Sentinel, “by enabling them to derive actionable clinical insights from the valuable body of data being generated by our TM+ services.
