

Giroud Alert: Tick Control

Problem

Deer Ticks are dangerous! Burrowing under the skin, Deer Ticks can cause serious harm to humans and pets.

Far worse than the bad rash and the pain of removing the tick, these blood sucking pests spread Lyme Disease as well as other serious illnesses.

Our suburbs are a hot spot for Lyme Disease cases according to the Center for Disease Control. Unfortunately, the problem is getting worst as more cases are reported each year.

Deer Tick prepares to bite. Tick removal and telltale bullseye rash.

Solution

Giroud's Tick Control programs targets ticks where they live. Deer Ticks like the shade and seek protection from the sun in ground level vegetation. Favorite hiding spots include high grasses, underbrush, shrubs and wooded areas. Here's what we do to control this dangerous pest:

1. **Property inspection:** Your Giroud Arborist will examine your property and show you where ticks are likely to thrive.
2. **Perimeter Clean-up:** Ticks are shade lovers and can't survive in the sun. The Giroud Team will eliminate shady tick habitats by:
 - Cleaning up and/or clearing overgrown areas.
 - Pruning tree branches and shrubs around the lawn edge to let in more sunlight.
3. **100% Organic Tick Control:** Giroud's specially licensed applicators will treat around the perimeter of your property and other high risk areas. Our 100% organic treatment is made from essential oils including Peppermint and Cedar oils which are a natural repellent.
4. **Deer Repellant:** Deer are the primary carrier of ticks to your property. Our Deer Repellant service is safe, water-resistant and will deter deer from feeding on your valuable plants!
5. **Plant Selection:** We will identify plants that are attracting deer to your yard and suggest alternative plants.
