

Optimize Your Emergency Response Speed

Facility-based emergency communications, automation, and control

Metis Secure develops advanced, facility-based emergency communications systems that help organizations respond to emergencies much more rapidly and effectively. It integrates with email and text alert layers to provide comprehensive, multi-modal emergency communications throughout a site or campus, and beyond.

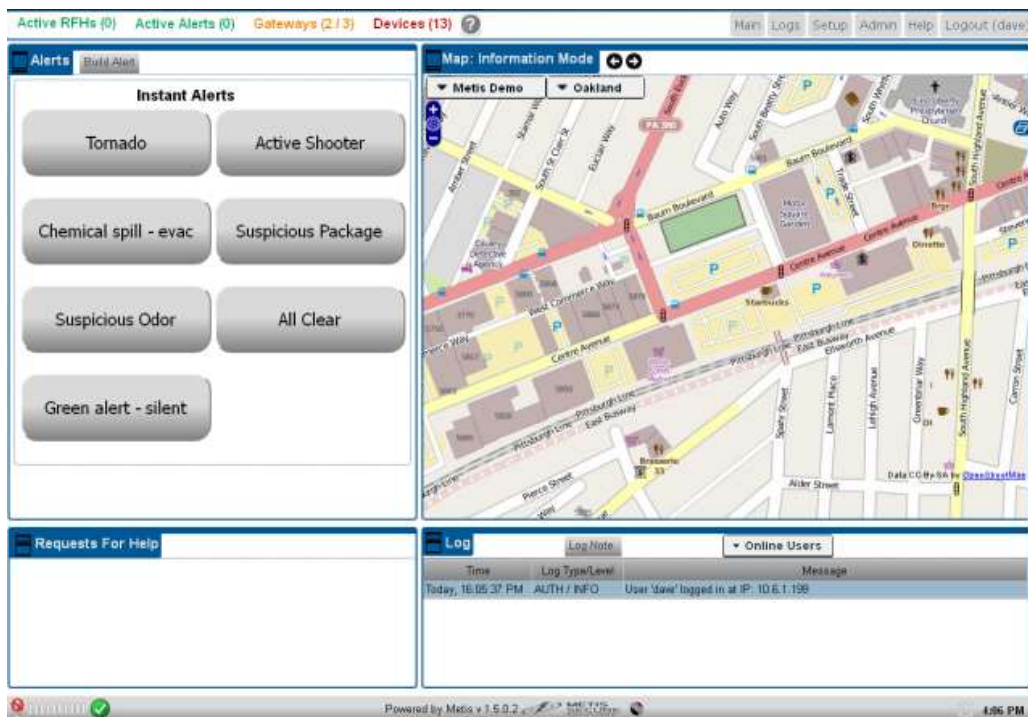

Command Center Software

Organizations use their Metis Secure Command Center software to instantly broadcast emergency alerts and instructions to everyone at their sites, or just to people at targeted locations. IP phones, computer screens, digital signs, PA systems, and more—and broadcast urgent, actionable voice instructions that give your people the information they need to protect themselves.

In addition, responders can answer help calls, speak to people in need and respond to panic buttons - while seeing their precise locations on the on-screen map. The system can also connect to a wide variety of sensors and data feeds, and can alert your site automatically if a dangerous situation is detected.

The Metis Secure system powers Metis Secure Help Stations and easily integrates with other emergency communication channels, facility security and life safety devices.

MS-5100 Indoor Help Station

Metis Secure's indoor Emergency Help Station is designed for use in hallways, laboratories, meeting rooms, lecture halls and other spaces where groups of people work or live.

In an emergency, the Help Station can instantly broadcast actionable voice instructions, display text built-in LCD text instructions, sound sirens and flash lights. Emergency personnel can immediately reach everyone at the location of an incident and direct them to safety.

In addition, people can rapidly reach on-site security, report a problem and request aid by pressing the built-in help button. Calls go to a central control room or to mobile security officers' handheld radios or mobile phones. Call locations are identified automatically, optimizing response speed.

MS-6100 Outdoor Help Station

Metis Secure's outdoor/rugged Emergency Help Station is designed for manufacturing floors, parking garages, outdoor areas, and other harsh environments. It has all the features of the indoor Help Station, plus a weather resistant, UV-rated case and internal heater for cold weather operations. It is easily retrofitted for existing blue light towers.

Panic Buttons

Integrating panic buttons that allow key personal to silently and discreetly request help when an event occurs. Variety of types including computer hot keys, wired via IP and wireless.

Redundant Networks

The Metis Secure system operates on Local Area Network, via a wired Ethernet connection or Wi-Fi. The Help Stations can automatically form an independent wireless mesh network for back-up, so the system still works even when power, internet, and phone networks fail.
