Find Ignored Threats (F.I.T.) in your organization with CYR3CON PR1ORITY
A key challenge facing cybersecurity professionals today is the ever-expanding number of software vulnerabilities.

An incredible 60% of enterprises are breached due to **known unsecured systems** they didn’t secure.

The world’s top vulnerability management teams address this problem using intelligence analysts to research vulnerabilities – manually making the call on what hackers are likely to exploit.

**CYR3CON PR1ORITY** automates the process – enabling you to analyze all vulnerabilities at scale – and in the process Finding Ignored Threats to your vulnerability management program.

**CYR3CON PR1ORITY** approaches cybersecurity from the hacker’s world view, identifying real threats to your assets based on attacker behaviors.
PR1ORITY identifies the vulnerabilities you should be paying attention to – not just those identified as critical or high. Justify the expense and showcase the value of vulnerability management up and down the management chain within your organization.
You’re concerned that different vulnerabilities pose unique real-world risk for the varied mix of platforms, devices, and applications in your enterprise. CYR3CON PR1ORITY enables enterprise scale threat research using objective AI backed by world-wide hacker community data. With CYR3CON PR1ORITY (available via web-based, REST API, or on-prem solutions) you can rapidly query, prioritize, and get updates on any vulnerabilities of concern.

Prioritize Remediation

Focus your teams on the specific and likely vulnerabilities that need attention, rather than the ever-growing list of possibilities.

You’re prioritizing vulnerability scan results, and by CVSS score, which is common industry practice. But you’ve still got a lot of work to do. Studies show that only a fraction of vulnerabilities are actually exploited-in-the-wild. CYR3CON PR1ORITY uses peer-reviewed attacker-focused AI to determine which vulnerabilities are most likely to be targeted.

Use PR1ORITY to go through your scan results and prioritize based on real-world threat. Once PR1ORITY identifies the vulnerabilities most likely to be exploited, use PR1ORITY to determine if and where a patch is available.
A large financial institution recently underwent a F.I.T. assessment with CYR3CON, revealing several ignored vulnerabilities with known threats. In this case study, we highlight one such vulnerability.

Here we see OpenSSL vulnerability CVE-2018-5407. It had a low/medium rating by the NIST CVSS scoring system, so it was not prioritized for remediation.

However, after a single mouse click, CYR3CON PR1ORITY identified significant threats to this vulnerability. CYR3CON’s patent-pending machine learning powered CyRating® raised the attention immediately to the team and revealed that not only had the vulnerability been exploited in the wild, but there was an available proof-of-concept code and numerous pieces of threat intelligence from various hacker communities discussing the availability of an exploit.

Here, as with many other customers, CYR3CON PR1ORITY was able to Find Ignored Threats.

**An Ignored Threat - Found.**

<table>
<thead>
<tr>
<th>CVE/MS #</th>
<th>Vulnerability Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cve-2018-5407</td>
<td>Simultaneous Multi-threading (SMT) in processors can enable local users to exploit software vulnerable to timing attacks via a side-channel timing attack on ‘port contention’.</td>
</tr>
</tbody>
</table>

- **NIST rating was medium/low**
- **CYR3CON’s machine learning & intelligence driven CyRating® was much higher over 38 times more likely for exploitation**
- **Supporting intelligence is provided and shown below**

**Intelligence:** уязвимость в smt/hyper-threading, позволяющая определить ключи шифрования чужих процессов уязвимость в smt/hyper-threading, позволяющая определить ключи шифрования чужих процессов. Группа исследователей из университета технологий в тампере (финляндия) и гаванского технологического университета (куба) продемонстрировали уязвимость (cve-2018-5407) в технологии одновременной многопоточности (smt или hyper-threading) на примере процессоров Intel...

**In-system translation:** vulnerability in smt/hyper-threading, allowing to determine the encryption keys of other people's processes. a group of researchers from the University of Technology in Tampere (Finland) and the Havana University of Technology (Cuba) demonstrated a vulnerability (cve-2018-5407) in the technology of simultaneous multi-threading (smt or hyper-threading ) on the example of intel processors...
Take advantage of the **CYR3CON PR1ORITY** F.I.T. Assessment from the industry’s most accurate predictive scorer of weaponized exploits today.

Find Ignored Threats (F.I.T.) Assessment

- **One week access to CYR3CON**'s web based platform

- **Second training session** to review identified threats and learn how to best communicate results to IT and management

- **Initial virtual instructional session** - learn how the world's top vulnerability management teams use CYR3CON to get ahead of threats

- **Assessment report produced by CYR3CON personnel** highlighting your ignored threats

---

A kick-off meeting with the CYR3CON team to help you understand the tool and the meaning of the indicators to get you started with the information you need to begin re-prioritizing your patching program.

CYR3CON will provide access to the **CYR3CON PR1ORITY** platform and an example analysis of your vulnerabilities to **Find Ignored Threats (F.I.T.)**. You will be able to use the CYR3CON platform as well as benefit from the assessment produced by the CYR3CON team based on the best-practices of vulnerability management we’ve learned while deploying CYR3CON technology to some of the world's top vulnerability management teams.

**CYR3CON** will then provide an out-brief to you and your team – highlighting the ignored threats and showing how the platform can be leveraged to produce the result. We also show how to showcase the results to management or IT personnel to justify the needed resources to avoid threats.
