WiFi On the spot Network Security & Monitoring

UserSafe™ technology

All Wi-Fi providers are NOT the same. *It is important to you, your business and your customers to be aware of the importance of Wi-Fi network security, monitoring and maintenance.*

What is UserSafe™ technology?

This technology ensures that no user can view or access another user's Wi-Fi device while logged on to your network. User's personal information, transactions and activites are protected. In addition, users are protected from a host of dangerous new "hacking" apps that allow users to tamper with and gain access to files on another user's device over Wi-Fi.

Aren't all business Wi-Fi networks secure?

Absolutely not! The New York Post recently wrote an article addressing the dangers of unsecured Wi-Fi "hotspots". In this article a major Internet provider was used as an example. NY Post investigators logged onto a hotspot at a chain coffee shop and within minutes were able to gain access to over 30 other computers that were logged on!

What makes Spot On Wi-Fi secure?

Spot On Networks fully managed Wi-Fi is ALWAYS secure. Spot On, through its UserSafe™ platform, provides client isolation, ensuring that no user is able to communicate with any other user over the Wi-Fi network. Users logged on are only able to communicate directly to the internet.

Why is Wi-Fi network monitoring necessary?

- **Bandwidth Monitoring:** We monitor your network activity 24/7 to ensure that your network maintains sufficient bandwidth compacity.
- **24/7 Support:** Spot On offers 24x7 customer support for both you and your network users.
- **Proactive Monitoring:** this ensures that any network issues are known and handled by us, typically before you are aware of them.
- **Content Filtering:** this ensures that users are not accessing information from the Internet that is inappropriate for your place of business.
- **CALEA compliance:** users need to create a unique username and password prior to using the Wi-Fi network to ensure that you are legally protected and in compliance with government regulation.

www.spotonnetworks.com

Spot On Networks ("SON") is the largest provider of high speed Wi-Fi Internet to the Multifamily industry. SON deploys fully managed Wi-Fi Networks to Multifamily properties, hotels and commercial spaces. Utilizing various technologies, SON provides high speed Wi-Fi capabilities throughout a residential complex that replace the need for DSL or Cable Modem services while providing complete mobility and faster service within that complex. SON Wi-Fi networks can also provide residential buildings with enhanced cellular and Smartphone coverage over Wi-Fi.
