

# Jama Contour Enterprise Reuse

## Put your enterprise knowledge to use.

The complexity and volume of ever-growing catalogs of product information — requirements, test cases and other strategic assets — is daunting. Multiple versions of the same information affects quality, increases the number of missed requirements, creates version control chaos and leads to rework and duplication of efforts.

Companies want to mandate reuse across the enterprise so they can build a library of assets that increase in value over time. With reuse, you can:

- **Improve Quality:** Refine reused items over time to enhance the caliber of products.
- **Reduce Risk:** Respond to change faster, catch errors earlier and save time and money.
- **Create Strategic Assets:** Leverage knowledge across teams to quickly and easily pull together new products from core assets.

“Approximately 85% of requirements are the same across launches. Contour’s Enterprise Reuse offers us an easy way to manage requirements and changes across the entire catalog so we can launch rockets faster.”

- Rocket & Spacecraft Manufacturer

## Let’s stop recreating the wheel.

With Enterprise Reuse, you create a set of assets once, and then use them to support other products, markets, channels and customers.

### Key Capabilities

Jama Contour lets you easily set up, monitor and control sets of assets across the entire product catalog.

**Set up:** Save time setting up new projects with Enterprise Reuse by pulling components, requirements, and processes and associated items. Create the same hierarchy; copy all related test cases and other assets or just some. You choose. No more cut and paste.

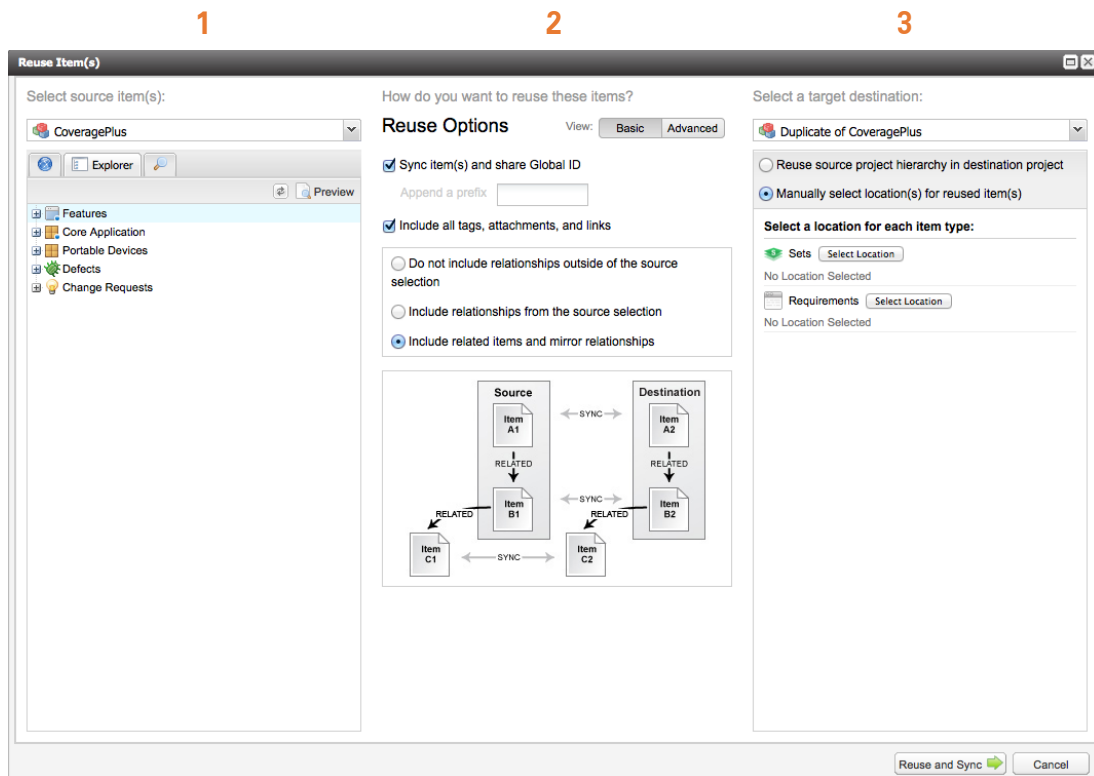

**Monitor:** Use Comparison Views to gain visibility across the entire product portfolio and quickly identify projects or areas to investigate. Understand when assets and their associated items branch from the original data set they are intended to be “in sync” with.

**Control:** With Selective Synchronization, control standardized use of common components with the flexibility to allow for branching at the project level. Now you can fix discrepancies, selectively update particular fields in bulk and synchronize relationships, links, tags, attachments and collections.

“The reuse capabilities in Contour help us accelerate mobile product development. We used to spend six months to stabilize a specification. Now it takes just one month.”  
- Multinational Semiconductor Chip Maker

### Enterprise Reuse has an easy-to-use interface that allows you to:

1. Select a source item
2. Decide how to reuse the source item
3. Choose a target location for the item
